Notices and Disclaimers

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

3DPRIMITIVE

3DPRIMITIVE		
Project:	BDW	
Source:	RenderCS	
Length Bias:	2	
<p>The 3DPRIMITIVE command is used to submit 3D primitives to be processed by the 3D pipeline. Typically the processing results in rendering pixel data into the render targets, but this is not required. The parameters passed in this command are forwarded to the Vertex Fetch function. The Vertex Fetch function will use this information to generate vertex data structures and store them in the URB. These vertices are then passed down the 3D pipeline.</p>		
Programming Note		
<p>If the threads spawned by this command are required to observe memory writes performed by threads spawned from a previous command, software must precede this command with a command that performs a (preferably pipelined) memory flush (e.g., 3D_PIPECONTROL).</p>

3DSTATE_BINDING_TABLE_POOL_ALLOC

3DSTATE_BINDING_TABLE_POOL_ALLOC			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
This command sets up the binding table pool for HW generated binding tables.			
Programming Notes			
When RS is enabled due to a MI_RS_CONTROL or MI_BATCH_BUFFER_START with RS enable bit set, driver must reprogram the 3DSTATE_BINDING_TABLE_POOL_ALLOC to ensure the resource streamer and render engine are in sync with the programming with the command. Otherwise there could be cases where RS sees that the Binding Table Pool is disabled while the render pipeline sees the binding table is enabled in the case the 3DSTATE_BINDING_TABLE_POOL_ALLOC was enabled while RS was off.

		3DSTATE_CHROMA_KEY															
2	31:0	<p>ChromaKey Low Value This field specifies the "low" (minimum) value of the chroma key range. Texel samples are considered "matching the key" if each component of the texel falls within the (inclusive) chroma range. See ChromaKey High Value for further format, programming info.</p>															
3	31:0	<p>ChromaKey High Value This field specifies the "high" (maximum) value of the chroma key range. Texel samples are considered "matching the key" if each component of the texel falls within the (inclusive) chroma range.</p> <p style="text-align: center;">Programming Notes</p> <p>ChromaKey values are specified using 8-bit channels. When using surface formats with less than 8 bits per channel, the device will expand channels by replicating the required number of MSBs into the LSBs of each channel. Software must account for this conversion when it programs Chromakey Low/High Values (e.g., by performing the same replication).</p> <p>For channels that do not exist in the actual surface (e.g., Alpha channel for non-ARGB maps), software must explicitly program full range high/low values (High=FFh, Low=0h for formats using unsigned chroma key values, High=7Fh, Low=FFh for formats using sign magnitude chroma key values) in order to effectively remove the comparison of that field from the ChromaKey function.</p> <p>For channels in SNORM format in the surface format, the value in the high/low value for that channel is interpreted in sign magnitude format. Negative zero value is not supported (use positive zero instead). For channels with mixed UNORM/SNORM formats (i.e. R5G5_SNORM_B6_UNORM), the ChromaKey is programmed as if all channels are SNORM.</p> <p>YUV ChromaKey will use an interpolated chrominance value from the map for comparison to the chroma key values for those texels without chrominance due to downsampling. The chrominance value used is the average of values to the left and right of the texel in question.</p> <p>It is UNDEFINED to program any component of the ChromaKey High Value to be less than the corresponding component of ChromaKey Low Value.</p> <p>Format = interpreted according to associated texel format "class":</p> <p>Only the surface formats listed as supported for chroma key in the surface formats table can be used with this feature. Use of any other surface format with chroma key enabled is UNDEFINED.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Surface Format</th> <th style="text-align: center;">31:24</th> <th style="text-align: center;">23:15</th> <th style="text-align: center;">16:8</th> <th style="text-align: center;">7:0</th> </tr> </thead> <tbody> <tr> <td>ARGB and BC (DXT) formats</td> <td style="text-align: center;">A</td> <td style="text-align: center;">R</td> <td style="text-align: center;">G</td> <td style="text-align: center;">B</td> </tr> <tr> <td>YCrCb formats</td> <td style="text-align: center;">A</td> <td style="text-align: center;">Cr</td> <td style="text-align: center;">Y</td> <td style="text-align: center;">Cb</td> </tr> </tbody> </table>	Surface Format	31:24	23:15	16:8	7:0	ARGB and BC (DXT) formats	A	R	G	B	YCrCb formats	A	Cr	Y	Cb

3DSTATE_CLEAR_PARAMS

3DSTATE_CLEAR_PARAMS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
This command defines the depth clear value delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).			
HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.			
DWord	Bit	Description

3DSTATE_CLIP

23:16	User Clip Distance Clip Test Enable Bitmask		
	Project:	All	
	Format:	Enable[8]	
	<p>This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made. DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.</p>		
15:13	Clip Mode		
	Project:	All	
	<p>This field specifies a general mode of the CLIP unit, when the CLIP unit is ENABLED.</p>		
	Value	Name	Description
	0h	NORMAL	TrivialAccept objects are passed down the pipeline, MustClip objects Clipped in the Fixed Function Clipper HW, TrivialReject and BAD objects are discarded
	1h	Reserved	
	2h	Reserved	
	3h	REJECT_ALL	All objects are discarded
	4h	ACCEPT_ALL	All objects (except BAD objects) are trivially accepted. This effectively disables the clip-test/clip-determination function. Note that the CLIP unit will still filter out adjacency information, which may be required since the SF unit does not accept primitives with adjacency.
	5h-7h	Reserved	
12:10	Reserved		
	Project:	All	
	Format:	MBZ	
9	Perspective Divide Disable		
	Project:	All	
	Format:	Disable	
	<p>This field disables the Perspective Divide function performed on homogeneous position read from the URB. This feature can be used by software to submit pre-transformed "screen-space" geometry for rasterization. This likely requires the W component of positions to contain "rhw" (aka 1/w) in order to support perspective-correct interpolation of vertex attributes. Likewise, the X, Y, Z components will likely be required to be X/W, Y/W, Z/W. Note that the device does not support clipping when perspective divide is disabled. Software must specify CLIPMODE_ACCEPT_ALL whenever it disables perspective divide. This implies that software must ensure that object positions are completely contained within the "guardband" screen-space limits imposed by the SF unit (e.g., by clipping in CPU SW before submitting the objects).</p>		
8	Non-Perspective Barycentric Enable		
	Project:	All	
	Format:	Enable	
	<p>This field enables computation of non-perspective barycentric parameters in the clipper, which are sent to SF unit in the must clip case. This field must be enabled if any non-perspective barycentric parameters are enabled in the Windower.</p>

		[0,16383]	Legal Range	y/v dimension	(Structure[RENDER_SURFACE_STATE][Surface Type]='SURFTYPE_CUBE')
		Programming Notes			
		The Height of the depth buffer must be the same as the Height of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_1D or SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).			
17:4		Width			
		Format: U14-1			
		This field specifies the width of the surface. If the surface is MIP-mapped, this field specifies the width of the base MIP level. The width is specified in units of pixels.			
		Value	Name	Description	Exists If
		[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]='SURFTYPE_1D')
		[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]='SURFTYPE_2D')
		[0,2047]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]='SURFTYPE_3D')
		[0,16383]	Legal Range	Width of surface - 1 (x/u dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]='SURFTYPE_CUBE')
		Programming Notes			
		The Width specified by this field must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field). For cube maps, Width must be set equal to Height. The Width of the depth buffer must be the same as the Width of the render target(s) (defined in SURFACE_STATE), unless Surface Type is SURFTYPE_1D or SURFTYPE_2D with Depth = 0 (non-array) and LOD = 0 (non-mip mapped).			

		3DSTATE_DEPTH_BUFFER			
	3:0	LOD			
		Format:	U4 for LOD units		
		Value	Name		
		[0,14]			
		Programming Notes			
		The LOD of the depth buffer must be the same as the LOD of the render target(s) (defined in SURFACE_STATE)			
5	31:21	Depth			
		Format:	U11-1		
		This field specifies the total number of levels for a volume texture or the number of array elements allowed to be accessed starting at the Minimum Array Element for arrayed surfaces. If the volume texture is MIP-mapped, this field specifies the depth of the base MIP level.			
		Value	Name	Description	Exists If
		[0,2047]	Legal Range	Number of array elements - 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D')
	[0,2047]	Legal Range	Number of array elements - 1	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')	
	[0,2047]	Legal Range	Depth of surface - 1 (r/z dimension)	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')	
	[0,0]	Legal Range	Must be zero	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_CUBE')	
			Programming Notes		
			The Depth of the depth buffer must be the same as the Depth of the render target(s) (defined in SURFACE_STATE).		
	20:10	Minimum Array Element			
		Format:	U11		
		For 1D and 2D Surfaces: This field indicates the minimum array element that can be accessed as part of this surface. The delivered array index is added to this field before being used to address the surface.			
		For 3D Surfaces This field indicates the minimum 'R' coordinate on the LOD currently being rendered to. This field is added to the delivered array index before it is used to address the surface.			
		For Other Surfaces This field is ignored			
		Value	Name	Exists If	
		[0,2047]	SURFTYPE_1D/2D	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_1D' Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_2D')	
		[0,2047]	SURFTYPE_3D	(Structure[RENDER_SURFACE_STATE][Surface Type]=='SURFTYPE_3D')

6:0	Reserved	Project: BDW	Format: MBZ	
4..5	63:10	Scratch Space Base Pointer	Project: BDW	Format: GeneralStateOffset[63:10]ScratchSpace
		Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if DS Function Enable is DISABLED.

3DSTATE_DX9_GENERATE_ACTIVE_PS

3DSTATE_DX9_GENERATE_ACTIVE_PS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
The 3DSTATE_DX9_GENERATE_ACTIVE_PS command is used to generate fixed functions' DX9 Constant Buffer. A DX9 Constant register is made active by writing it out to the constant buffer.			
Programming Notes			
Restriction: The global and local buffers are not initialized after reset. Any data written without being initialized will be undefined. DX9 constant buffers are written due to context save/restore or the Generate Active Command.

3DSTATE_GATHER_CONSTANT_DS

3DSTATE_GATHER_CONSTANT_DS	
Project:	BDW
Source:	RenderCS
Length Bias:	2
<p>This command uses the constant buffer binding table entries to reference constant buffer surface states for the DS unit. The constant data in these is gathered and packed according to a gather table contained in this command.</p>	

Programming Notes	
The HW generated binding table must be enabled to use this command.	
The constant buffer block (group of aligned 16 binding table entries) must be set before this command is issued.	
If the surface type is NULL, any fetch using the surface state base address is not bound by the size of the surface state and the fetch still occurs.	
The length of the gather table is derived from the total length of the command. The command length is in DWords, but the gather table entries are 16 bits in length. If there is an unused odd entry at the end of the command the channel mask should be set to all 0s.	
When a 3DSTATE_GATHER_CONSTANT_* command is used there must be a matching 3DSTATE_CONSTANT_*. Furthermore the 3DSTATE_CONSTANT_* must occur in the same order as the 3DSTATE_GATHER_CONSTANT_*. For example if a 3DSTATE_GATHER_CONSTANT_VS occurs before a 3DSTATE_GATHER_CONSTANT_PS, then the 3DSTATE_CONSTANT_VS must occur before the 3DSTATE_CONSTANT_PS.	
If Gather pool is enabled, there must be a corresponding 3DSTATE_GATHER_CONSTANT command with any 3DSTATE_CONSTANT for any particular shader. To avoid any update to the Gather pool, and yet program the 3DSTATE_CONSTANT for a particular shader, send a 3DSTATE_GATHER_CONSTANT command with all valid bits set to zero.	
<p>The following commands must be executed after any 3DSTATE_GATHER_CONSTANT_* command that has Constant Buffer Valid greater than zero:</p> <ul style="list-style-type: none"> • (N times, minimum number is 4) MI_RS_STORE_DATA_IMM – To force engine idle before executing the next instruction. Write must occur to address that will not corrupt memory: • Resource Streamer Flush = 1 • 3DSTATE_GATHER_CONSTANT_* (Ensures correct timing of sync between resource streamer and render pipeline) • The Constant Buffer Valid field should be zero and the Dword length equal to 1h. • 3DSTATE_CONSTANT_*: • All values match the previous 3DSTATE_CONSTANT_*

3DSTATE_GATHER_CONSTANT_HS

3DSTATE_GATHER_CONSTANT_HS		
Project:	BDW	
Source:	RenderCS	
Length Bias:	2	
<p>This command uses the constant buffer binding table entries to reference constant buffer surface states for HS unit. The constant data in these is gathered and packed according to a gather table contained in this command.</p>		
Programming Notes		
<p>The HW generated binding table must be enabled to use this command.</p>		
<p>The constant buffer block (group of aligned 16 binding table entries) must be set before this command is issued.</p>		
<p>If the surface type is NULL, any fetch using the surface state base address is not bound by the size of the surface state and the fetch still occurs.</p>		
<p>The length of the gather table is derived from the total length of the command. The command length is in DWords, but the gather table entries are 16 bits in length. If there is an unused odd entry at the end of the command the channel mask should be set to all 0s.</p>		
<p>When a 3DSTATE_GATHER_CONSTANT_* command is used there must be a matching 3DSTATE_CONSTANT_*. Furthermore the 3DSTATE_CONSTANT_* must occur in the same order as the 3DSTATE_GATHER_CONSTANT_*. For example if a 3DSTATE_GATHER_CONSTANT_VS occurs before a 3DSTATE_GATHER_CONSTANT_PS, then the 3DSTATE_CONSTANT_VS must occur before the 3DSTATE_CONSTANT_PS.</p>		
<p>If Gather pool is enabled, there must be a corresponding 3DSTATE_GATHER_CONSTANT command with any 3DSTATE_CONSTANT for any particular shader. To avoid any update to the Gather pool, and yet program the 3DSTATE_CONSTANT for a particular shader, send a 3DSTATE_GATHER_CONSTANT command with all valid bits set to zero.</p>		
<p>The following commands must be executed after any 3DSTATE_GATHER_CONSTANT_* command that has Constant Buffer Valid greater than zero:</p> <ul style="list-style-type: none"> • (N times, minimum number is 4) MI_RS_STORE_DATA_IMM – To force engine idle before executing the next instruction. Write must occur to address that will not corrupt memory: • Resource Streamer Flush = 1 • 3DSTATE_GATHER_CONSTANT_* (Ensures correct timing of sync between resource streamer and render pipeline) • The Constant Buffer Valid field should be zero and the Dword length equal to 1h. • 3DSTATE_CONSTANT_*: • All values match the previous 3DSTATE_CONSTANT_*

3DSTATE_GATHER_POOL_ALLOC

DWord		Bit	Description
3DSTATE_GATHER_POOL_ALLOC			
Project:		BDW	
Source:		RenderCS	
Length Bias:		2	
This command sets up the Gather Pool for Gather Buffers.			
Programming Notes			
The gather constant feature has a simple all or nothing model. If the gather constants are enable, the driver must enable the gather pool and use 3D_STATE_GATHER_CONSTANT_* cmds to gather and load the URB. If the gather buffer is disabled the driver must use the existing 3D_STATE_CONSTANT_* cmds to load the URB.			
The gather constants can only be enabled if the binding table generator is also enabled. This command must only be programmed when resource streamer is enabled thru batch buffer start and MI_RS_CONTROL has not disabled resource streamer.

This offset applies to all Vertex URB entries passed to the thread.	
	Project:	All				
Double Buffer Armed By:	Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. This offset applies to all Vertex URB entries passed to the thread.					

3DSTATE_GS		
3:0	Dispatch GRF Start Register For URB Data	
	Project:	All
	Format:	U4
Specifies the starting GRF register number for the URB portion (Constant + Vertices) of the thread payload.		
	Value	Name
	[0,15]	indicating GRF [R0, R15]
Programming Notes		
If Include Vertex Handles is enabled (pull or hybrid handles case), then For simd4x2: For DUAL_OBJECT dispatch mode this field should be: $(((2 * \text{numVerticesPerObject}) + 8 - 1) / 8) + 1$ For SINGLE and DUAL_INSTANCE dispatch modes this field should be: $((\text{numVerticesPerObject} + 8 - 1) / 8) + 1$ If Include Primitive ID is set, then add 1 to the value obtained by using the above For simd8: For InstanceCount == 1: numVerticesPerObject + 2 For InstanceCount > 1: 3		
7	31:24 Maximum Number of Threads	
	Project:	BDW
	Format:	U8/2-1 Thread Count
Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance.		
	Value	Name
	[3,251]	indicating thread count of [8,504]
Programming Notes		
Note that this "Maximum Number of Threads" field is different from the other FF stages in that only an even number of threads.		
23:20	Control Data Header Size	
	Format:	U4
Specifies the number of 32B units of control data header located at the start of the GS URB entry. The value 0 indicates there is no control data header, and Control Data Format is ignored. Software must ensure that the Control Data Header Size is sufficient to accommodate the maximum number of vertices output by the GS thread. It is UNDEFINED for a GS thread to report more output vertices than can be accommodated in a non-zero-sized header. (If the header size is zero, by definition neither cut nor StreamID bits are defined.)		
	Value	Name
	[0,8]	32B Units

3DSTATE_GS									
19:15	<p>Instance Control</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 40%;">Format:</td> <td>U5-1 #Instances</td> </tr> </table> <p>Specifies the number of instances (minus one) for each input object. To avoid confusion, this document uses the term "InstanceCount" to refer to InstanceControl+1, with a range of [1,32] If InstanceCount>1, DUAL_OBJECT mode is invalid. Software will likely want to use DUAL_INSTANCE mode for higher performance, but SINGLE mode is also supported. When InstanceCount=1 (one instance per object), software can decide which dispatch mode to use. DUAL_OBJECT mode would likely be the best choice for performance, followed by SINGLE mode. DUAL_INSTANCE mode is not recommended but is supported.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 20%;">Name</th> <th style="width: 60%;">Description</th> </tr> </thead> <tbody> <tr> <td>[0,31]</td> <td></td> <td>Indicating [1,31] instances</td> </tr> </tbody> </table>	Format:	U5-1 #Instances	Value	Name	Description	[0,31]		Indicating [1,31] instances

When the GS is disabled, StreamID will be output as 0.</p>	Format:	U2						
Format:	U2								

3DSTATE_GS

12:11	Dispatch Mode Format: U2		
This field specifies how the GS unit dispatches multiple instances and/or multiple objects.			
Value	Name	Description	Programming Notes
0h	Single	Each thread shades a single instance of one object.	
1h	Dual Instance	Each thread shades possibly two instances of one object. If the InstanceCount is odd, a trailing dispatch of only one instance will be made for each object received. Not recommended if InstanceCount = 1, assuming a kernel optimized for SINGLE or DUAL_OBJECT dispatch would outperform a kernel compiled for DUAL_INSTANCE but only passed one instance.	
2h	Dual Object	Each thread shades one instance of possibly two objects. The GS unit attempt to pair objects together into one dispatch, but under some circumstances only one object may be dispatched (as controlled by the DispatchMask generated by the GS unit). Not valid for objects with more than 16 vertices per object. Not valid if InstanceCount > 1 (more than one instance per object).	
3h	SIMD8	Each thread shades up to 8 different objects or (if InstanceCount >1) 8 instances of a single object.	[BDW] Not valid for objects with more than 6 vertices per object.
Programming Notes			
The GS must be allocated at least two URB handles or behavior is UNDEFINED for Dual Instance or Dual Object mode.			
At least 8 URB entries must be allocated in order to use SIMD8 DispatchMode.			
10	Statistics Enable Format: Enable		
This bit controls whether GS-unit-specific statistics register(s) can be incremented.			
Value	Name	Description	
0h	Disable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT cannot increment	
1h	Enable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT can increment	

3DSTATE_GS												
1	<p>Discard Adjacency</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 70%;">Format:</td> <td>Enable</td> </tr> </table> <p>When set, adjacent vertices <u>will not be passed</u> in the GS payload when objects with adjacency are processed. Instead, only the non-adjacent vertices will be passed in the same fashion as the without-adjacency form of the primitive. Software should set this bit whenever a GS kernel is used that <u>does not expect</u> adjacent vertices. This allows both with-adjacency/without-adjacency variants of the primitive to be submitted to the pipeline (via 3DPRIMITIVE) - the GS unit will silently discard any adjacent vertices and present the GS thread with only the internal object. When clear, adjacent vertices <u>will be passed</u> to the GS thread, as dictated by the incoming primitive type. Software should only clear this bit when a GS kernel is used that does expect adjacent vertices. E.g., if the GS kernel is compiled to expect a TRIANGLE_ADJ object, software must clear this bit. Software should also clear this bit if the GS kernel expects a POINT or PATCHLIST_n object (which don't have with-adjacency variants).</p> <p>The only hardware assistance is to allow the submission of a with-adjacency variant of a primitive when operating with a GS kernel that expects the without-adjacency variant of the object. (E.g., when the GS kernel is compiled to expect a TRIANGLE object, software should set this bit just in case a TRILIST_ADJ is submitted to the pipeline.) Note that the GS unit is otherwise not aware of the object type that is expected by the GS kernel. It is up to software to ensure that the submitted primitive type (in 3DPRIMITIVE) is otherwise compatible with the object type expected by the GS kernel. (E.g., if the GS kernel expects a LINE_ADJ object, only LINELIST_ADJ or LINESTRIP_ADJ should be submitted, otherwise the GS kernel will produce unpredictable results.) Also note that it is possible to craft a GS kernel which can accept any object type that's thrown at it by first examining the PrimType passed in the payload and then using this info to correctly interpret the number of vertices passed in the payload.</p>	Format:	Enable

Format:	Enable[8]						

3DSTATE_HIER_DEPTH_BUFFER

3DSTATE_HIER_DEPTH_BUFFER			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
<p>This command sets the surface state of the hierarchical depth buffer, delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).</p> <p>WM HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.</p>			
Programming Notes			
<p>Restriction: Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set, followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH).</p>

	Default Value:	1h Excludes Dword (0,1)	
	Project:	All	
	Format:	=n Total Length - 2	
1	31	Modify Enable (Current Repeat Counter, Current Stipple Index)	
		Project:	All
		Format:	Enable
	Modify enable for Current Repeat Counter and Current Stipple Index fields.		
	<p style="text-align: center;">Programming Notes</p> <p>It is provided only for HW-generated commands as part of context save/restore. SW must initialize the current repeat counter, current stipple count fields if it sets this bit to enable. SW must set this bit to reset the stipple count.</p>		
30	Reserved		
	Project:	All	
	Format:	MBZ	

3DSTATE_LINE_STIPPLE		
	29:21 Current Repeat Counter	
	Project: All	
	Format: U9	
	This field sets the HW-internal repeat counter state. SW must initialize it to 1 if the modify enable is set.	
20	Reserved	
	Project: All	
19:16	Current Stipple Index	
	Project: All	
	Format: U4	
	This field sets the HW-internal stipple pattern index. SW must initialize it to 0 if the modify enable is set.	
15:0	Line Stipple Pattern	
	Project: All	
	Format: 16 bit mask Bit 15 = most significant bit, Bit 0 = least significant bit	
Specifies a pattern used to mask out bit specific pixels while rendering lines.		
2	31:15 Line Stipple Inverse Repeat Count	
	Project: All	
	Format: U1.16	
	Range: [0.00390625, 1.0]	
	Specifies the inverse (truncated) of the repeat count for the line stipple function.	
	14:9	Reserved
		Project: All
8:0	Line Stipple Repeat Count	
	Project: All	
	Format: U9	
	Specifies the repeat count for the line stipple function.	
	Value	Name
[1, 256]		

3DSTATE_MONOFILTER_SIZE

3DSTATE_MONOFILTER_SIZE					
Project:	BDW				
Source:	RenderCS				
Length Bias:	2				
This state specifies the size of the filter which is used when filtering in MAPFILTER_MONO mode.					
DWord	Bit	Description			
0	31:29	Command Type			
		Default Value:	3h GFXPIPE		
		Format:	OpCode		
	28:27	Command SubType			
		Default Value:	3h GFXPIPE_3D

3DSTATE_MULTISAMPLE

3DSTATE_MULTISAMPLE			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
The 3DSTATE_MULTISAMPLE command is used to specify multisample state associated with the current render target/depth buffer.			
Programming Notes			
It is illegal to render to surfaces with multiple different values of the state fields in this command.			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	Command SubType	
		Default Value:	3h GFXPIPE_3D
		Format:	OpCode
	26:24	3D Command Opcode	
		Default Value:	0h 3DSTATE_PIPELINED
		Format:	OpCode
	23:16	3D Command Sub Opcode	
Default Value:		0Dh 3DSTATE_MULTISAMPLE	
Format:		OpCode	
15:8	Reserved		
	Project:	All	
	Format:	MBZ	
7:0	Dword Length		
	Default Value:	0h	
	Project:	All	
	Format:	=n Total Length - 2	
	Excludes Dword (0,1)		
1	31:6	Reserved	
		Project:	All
		Format:	MBZ

3DSTATE_MULTISAMPLE		
5	Pixel Position Offset Enable	
	Project:	BDW
	Format:	U1
Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions.		
Programming Notes		
Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel positions by 0.5 both in horizontal and vertical directions.		
It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration.		
SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.		
4	Pixel Location	
	Project:	All
	Format:	U1
This field specifies where the device evaluates "pixel" (vs. centroid or sample) values/attributes.		
	Value	Name
		Description
	0h	CENTER
	1h	UL_CORNER
		Use the pixel center (0.5, 0.5 offset)
		Use the pixel upper-left corner
Programming Notes		
The programming of this field is assumed to be a function of the API being supported. Specifically, it is expected that OpenGL and DX10+ APIs require CENTER selection, while DX9-APIs require UL_CORNER selection.		
When 3DSTATE_RASTER:: ForcedSampleCount is other than NUMRASTSAMPLES_0, this field must be 0h.		

3DSTATE_MULTISAMPLE			
3:1	Number of Multisamples		
	Project:	All	
	Format:	U3	
	This field specifies how many samples/pixel exist in all RTs and the Depth Buffer, as $\log_2(\#\text{samples})$. This field is valid regardless of the setting of Multisample Rasterization Mode .		
	Value	Name	Description
	0h	1	1 sample/pixel
	1h	2	2 samples/pixel
	2h	4	4 samples/pixel
	3h	8	8 samples/pixel
	5h-7h	Reserved	
Programming Note			
The setting of this field must match the Number of Multisamples field in SURFACE_STATE of all bound render targets.			
0	Reserved		
	Project:	All	
	Format:	MBZ	

3DSTATE_POLY_STIPPLE_OFFSET

3DSTATE_POLY_STIPPLE_OFFSET			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
The 3DSTATE_POLY_STIPPLE_OFFSET command is used to specify the origin of the repeated screen-space Polygon Stipple Pattern as an X, Y offset from the Color Buffer origin.			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	3h GFXPIPE
		Format:	OpCode

3DSTATE_PS																
25:18	Binding Table Entry Count															
	Project:	All														
	Description															
	<p>Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. Note: For kernels using a large number of binding table entries, it may be advantageous to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if [PS Function Enable] is DISABLED.</p> <p>When [HW Generated Binding Table] bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched. See 3D Pipeline for more information.</p>															
Programming Notes																
When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.																
17	Thread Dispatch Priority															
	Project:	All														
	Specifies the priority of the thread for dispatch.

		3DSTATE_PS		
6	31:23	Maximum Number of Threads Per PSD		
		Project:	BDW	
		Format:	U8-2 Representing Thread Count	
		Description		Project
		Range = [0, 62] --> [2, 64] threads. Specifies the maximum number of simultaneous threads allowed to be active per PSD. Depending on the GT mode register, Number of PSDs in the system determine maximum number PS threads per configuration.		BDW
		Has 2 PSDs therefore actual range for max PS threads is [4,128].		BDW:GT1
		Has 3 PSDs therefore actual range for max PS threads is [6,192].		BDW:GT2
		Has 6 PSDs therefore actual range for max PS threads is [12,384].		BDW:GT3
		Programming Notes		
		If this field is changed between 3DPRIMITIVE commands, a PIPE_CONTROL command with Stall at Pixel Scoreboard set is required to be issued.

3DSTATE_PS			
		This field is set to enable clear value resolve on non-multisampled render targets. See "Render Target Resolve" for restrictions on enabling this field.	
5	Reserved		
	Project:	BDW	
	Format:	MBZ	
4:3	Position XY Offset Select		
	Project:	All	
	Format:	U2 Enumerated Type	
	This field specifies if/what Position XY Offset values are passed in the PS payload. Note that these are per-slot (pixel sample) offsets, and therefore separate from the subspan XY coordinates passed in R1.		
	Value	Name	Description
	0h	POSOFFSET_NONE	No Position XY Offsets are included in the PS payload.
	1h	Reserved	
	2h	POSOFFSET_CENTROID	Position XY Offsets will be passed in the PS payload, and these will reflect the Centroid position(s).
	3h	POSOFFSET_SAMPLE	Position XY Offsets will be passed in the PS payload, and these will reflect the multisample position(s).
	Programming Notes		
SW Recommendation: If the PS kernel needs the Position Offsets to compute a Position XY value, this field should match Position ZW Interpolation Mode to ensure a consistent position.xyzw computation			
If the PS kernel does not need the Position XY Offsets to compute a Position Value, then this field should be programmed to POSOFFSET_NONE, as the PS kernel should be using the various barycentric inputs to evaluate other-than-position attributes. However, this field can be used to pass Centroid or Sample offsets in the payload for special test modes (e.g., where barycentric coordinates are computed in the PS vs. being HW-generated and passed in the payload).			
MSDISPMODE_PERSAMPLE is required in order to select POSOFFSET_SAMPLE.			
2	32 Pixel Dispatch Enable		
	Project:	All	
	Format:	Enable	
Enables the Windower to dispatch 8 subspans in one payload. Variable Pixel Dispatch in Section: Pixel Grouping (Dispatch size) control for valid pixel dispatch combinations.

3DSTATE_PUSH_CONSTANT_ALLOC_HS			
1	31:21	Reserved	
		Project: BDW	
		Format: MBZ	
	20:16	Constant Buffer Offset	
		Project: BDW	
		Format: U5	
		Specifies the offset of the HS constant buffer into the URB.	
		Value	Name
	[0,31]	(0KB - 31KB) Increments of 2KB	
	15:6	Reserved	
		Project: BDW	
		Format: MBZ	
5:0	Constant Buffer Size		
	Project: BDW		
	Format: U6		
	Specifies the size of the HS constant buffer. This value will determine the amount of data the command stream can pre-fetch before the buffer is full. Value of zero is only valid when constants are not enabled for HS.		
	Value	Name	
[0,32]	(0KB - 32KB) Increments of 2KB		

3DSTATE_PUSH_CONSTANT_ALLOC_PS

3DSTATE_PUSH_CONSTANT_ALLOC_PS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
This command sets up the URB configuration for PS Push Constant Buffer.			
Programming Notes			
Restriction:			
<ul style="list-style-type: none"> The sum of the Constant Buffer Offset and the Constant Buffer Size may not exceed the maximum value of the Constant Buffer Size. The sum of the constant length programmed in 3DSTATE_CONSTANT_PS must be equal or smaller then the size of the allocated space in the URB including the buffering for half cachelines. See Push Constant URB Allocation section for more details. The 3DSTATE_CONSTANT_PS must be reprogrammed prior to the next 3DPRIMITIVE command after programming the 3DSTATE_PUSH_CONSTANT_ALLOC_PS.

3DSTATE_RASTER

17:16	Cull Mode	
	Project:	All
	Format:	3D_CullMode
	Controls removal (culling) of triangle objects based on orientation. The cull mode only applies to triangle objects and does not apply to lines, points or rectangles.	
	Value	Name
	Description	
	0h	CULLMODE_BOTH All triangles are discarded (i.e., no triangle objects are drawn)
	1h	CULLMODE_NONE [Default] No triangles are discarded due to orientation
	2h	CULLMODE_FRONT Triangles with a front-facing orientation are discarded
	3h	CULLMODE_BACK Triangles with a back-facing orientation are discarded
	Programming Notes	
	Orientation determination is based on the setting of the Front Winding state.	
15	Reserved	
	Project:	All
	Format:	MBZ
14	Force Multisampling	
	Project:	All
	This field provides a work around override for the computation of SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode.	
	Value	Name
	Description	
	0h	Normal Multisampling mode is computed by HW according to formula for signal SF_INT::Multisample Rasterization Mode and WM_INT::Multisample Rasterization Mode in vol2a.11 3D Pipeline Windower [BDW] > Windower Pipelined State > 3DSTATE_WM > 3DSTATE_WM [BDW].
	1h	Force Forces the DX Multisampling mode to be used directly
13	Smooth Point Enable	
	Project:	BDW
	Format:	Enable
	Software sets this according to API. When OGL and smooth point rasterization is required, this bit must be set. HW ignores this bit for primitives other than points.

Format:	16 bit mask Right-justified bitmask (Bit 0 = Sample0). Number of bits that are used is determined by Num Multisamples (3DSTATE_MULTISAMPLE)								
Programming Notes									
<ul style="list-style-type: none"> • If Number of Multisamples is NUMSAMPLES_1, bits 15:1 of this field will be zeroed by HW. • If Number of Multisamples is NUMSAMPLES_2, bits 15:2 of this field will be zeroed by HW. • If Number of Multisamples is NUMSAMPLES_4, bits 15:4 of this field will be zeroed by HW. • If Number of Multisamples is NUMSAMPLES_8, bits 15:8 of this field will be zeroed by HW. 									

3DSTATE_SAMPLE_PATTERN

3DSTATE_SAMPLE_PATTERN			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
<p>The 3DSTATE_SAMPLE_PATTERN command is used to specify the sample offsets for all multisample sample modes. The set of offset used will be selected based on the multisample mode. This is non-pipelined state.</p>			
Programming Notes			
<p>When programming the sample offsets (for NUMSAMPLES_4 or _8 and MSRASTMODE_XXX_PATTERN), the order of the samples 0 to 3 (or 7 for 8X, or 15 for 16X) must have monotonically increasing distance from the pixel center. This is required to get the correct centroid computation in the device.</p>

3DSTATE_SAMPLER_PALETTE_LOAD0

3DSTATE_SAMPLER_PALETTE_LOAD0			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
<p>The 3DSTATE_SAMPLER_PALETTE_LOAD0 instruction is used to load 32-bit values into the first texture palette. The texture palette is used whenever a texture with a paletted format (containing "Px [palette0]") is referenced by the sampler.</p> <p>This instruction is used to load all or a subset of the 256 entries of the first palette. Partial loads always start from the first (index 0) entry.</p>

	29	Force Vertex URB Entry Read Length	
		Project:	BDW
	Format:		Enable
	This field provides a work around override for the computation of SBE_INT::Vertex URB Entry Read Length. If asserted, 3DSTATE_SBE::Vertex URB Entry Read Length is be used directly. Otherwise, SBE_INT::Vertex URB Entry Read Length is computed normally.		
	28	Force Vertex URB Entry Read Offset	
Project:		BDW	
Format:		Enable	
This field provides a work around override for the computation of SBE_INT::Vertex URB Entry Read Offset. If asserted, 3DSTATE_SBE::Vertex URB Entry Read Offset is be used directly. Otherwise, SBE_INT::Vertex URB Entry Read Offset is computed normally.			

3DSTATE_SBE			
27:22	Number of SF Output Attributes		
	Project:	BDW	
	Format:	U6 count of attributes	
	Specifies the number of vertex attributes passed from the SF stage to the WM stage (does not include Position).		
	Value	Name	
	[0,32]		
21	Attribute Swizzle Enable		
	Format:	Enable	
Enables the SF to perform swizzling on (up to the first 16) vertex attributes. If DISABLED, all vertex attributes are passed through.			
20	Point Sprite Texture Coordinate Origin		
	This state controls how Point Sprite Texture Coordinates are generated (when enabled on a per-attribute basis by Point Sprite Texture Coordinate Enable).		
	Value	Name	Description
	0h	UPPERLEFT	Top Left = (0,0,0,1)Bottom Left = (0,1,0,1)Bottom Right = (1,1,0,1)
	1h	LOWERLEFT	Top Left = (0,1,0,1)Bottom Left = (0,0,0,1)Bottom Right = (1,0,0,1)
19	Primitive ID Override Component W		
	Project:	BDW	
	Format:	Enable	
	If set, the W component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.		
18	Primitive ID Override Component Z		
	Project:	BDW	
	Format:	Enable	
	If set, the Z component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.		
17	Primitive ID Override Component Y		
	Project:	BDW	
	Format:	Enable	
	If set, the Y component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.		
16	Primitive ID Override Component X		
	Format:	Enable	
If set, the X component of output attribute selected by Primitive ID Override Attribute Select is overridden with the Primitive ID.			

3DSTATE_SBE					
	15:11	Vertex URB Entry Read Length			
		Format: U5			
		Specifies the amount of URB data read for each Vertex URB entry, in 256-bit register increments.			
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[1,16]</td> <td></td> </tr> </tbody> </table>	Value	Name	[1,16]
Value	Name				
[1,16]					
		<p style="text-align: center;">Programming Notes</p> <p>It is UNDEFINED to set this field to 0 indicating no Vertex URB data to be read. This field should be set to the minimum length required to read the maximum source attribute. The maximum source attribute is indicated by the maximum value of the enabled Attribute # Source Attribute if Attribute Swizzle Enable is set, Number of Output Attributes-1 if enable is not set. $read_length = \text{ceiling}((\text{max_source_attr}+1)/2)$</p>			
	10:5	Vertex URB Entry Read Offset			
		Project: BDW			
		Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB.			
	4:0	Primitive ID Override Attribute Select			
		Project: BDW			
		Specifies which attribute is overridden w/ the Primitive ID			
		<p style="text-align: center;">Programming Notes</p> <p>Set all Primitive ID Override Component Select X/Y/Z/W to 0 to indicate there is no Primitive ID override.</p>			
2	31:0	Point Sprite Texture Coordinate Enable			
		Format: Enable[32]			
		When processing point primitives, the attributes from the incoming point vertex are typically copied to the point object corner vertices. However, if a bit is set in this field, the corresponding Attribute is selected as a Point Sprite Texture Coordinate, in which case each corner vertex is assigned a pre-defined texture coordinate as defined by the Point Sprite Texture Coordinate Origin state bit. Bit 0 corresponds to output Attribute 0.			
3	31:0	Constant Interpolation Enable			
		Format: Enable[32]			
		This field is a bitmask containing a Constant Interpolation Enable bit for each corresponding attribute. If a bit is set, that attribute will undergo constant interpolation, and the corresponding WrapShortest Enable bits (if defined) will be ignored. If a bit is clear, components which are not enabled for WrapShortest interpolation (if defined) will be linearly interpolated.

	Format:	MBZ	
7:0	DWord Length		
	Default Value:	6h Excludes DWord (0,1)	
	Format:	=n	
	Total Length - 2		
1	31	SO Buffer Enable	
		Format:	Enable
<p>If set, stream output to SO Buffer is enabled,, if 3DSTATE_STREAMOUT::SO Function ENABLE is also enabled..If clear, the SO Buffer is considered "not bound" and effectively treated as a zero-length buffer for the purposes of SO output and overflow detection. If an enabled stream's Stream to Buffer Selects includes this buffer it is by definition an overflow condition. That stream will cause no writes to occur, and only SO_PRIM_STORAGE_NEEDED[<stream>] will increment.</p>			
1	30:29	SO Buffer Index	
		Format:	U2
Specifies which of the four SO Buffers is being defined.			

3DSTATE_SO_BUFFER		
	28:22	SO Buffer Object Control State
		Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for the SO buffer.
	21	Stream Offset Write Enable
	Format: Enable When set, this field allows the hardware to write SO_WRITE_OFFSET[Buffer#] as specified in the Stream Offset field.	
	Programming Notes	
	The field is operates irrespective of whether SO Buffer Enable is set or clear.	
	20	Stream Output Buffer Offset Address Enable
		Format: Enable When set, this field allows the hardware to read/write the stream output buffer offset as specified in the "Stream Output Buffer Offset Address" field.
		Programming Notes
	The field is operates irrespective of whether SO Buffer Enable is set or clear.

	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[0,128]</td> <td style="text-align: center;">entries</td> </tr> </tbody> </table>	Value	Name	[0,128]	entries						
	Value	Name									
	[0,128]	entries									
	23:16 Num Entries [2]										
	Format: U8 #entries										
	Specifies the number of valid SO_DECL entries for Stream 2. (See notes in Num Entries [0] field description).										
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[0,128]</td> <td style="text-align: center;">entries</td> </tr> </tbody> </table>	Value	Name	[0,128]	entries						
Value	Name										
[0,128]	entries										
15:8 Num Entries [1]											
Format: U8 #entries											
Specifies the number of valid SO_DECL entries for Stream 1. (See notes in Num Entries [0] field description).											
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[0,128]</td> <td style="text-align: center;">entries</td> </tr> </tbody> </table>	Value	Name	[0,128]	entries							
Value	Name										
[0,128]	entries										

3DSTATE_SO_DECL_LIST				
	7:0	Num Entries [0]		
		Format: U8 #entries		
		Specifies the number of valid SO_DECL entries for Stream 0. Note that the SO_DECLs are programmed in groups of four (one SO_DECL for each of the four streams). Therefore the number of 2-DWord groups of SO_DECLs supplied in this command is derived from the stream(s) with the most valid SO_DECLs. The NumEntries value specific to each stream will indicate how many SO_DECLs are valid for that particular stream. Any trailing invalid SO_DECLs supplied for streams with fewer valid SO_DECLs will be ignored. It is legal to specify Num Entries = 0 for all four streams simultaneously. In this case there will be no SO_DECLs included in the command (only DW 0-2). Note that all Stream to Buffer Selects bits must be zero in this case (as no streams produce output).		
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[0,128]</td> <td style="text-align: center;">entries</td> </tr> </tbody> </table>	Value	Name
Value	Name

		Format: SO_DECL_ENTRY		

3DSTATE_STENCIL_BUFFER

3DSTATE_STENCIL_BUFFER			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
This command sets the surface state of the separate stencil buffer, delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).			
WM HW will internally manage the draining pipe and flushing of the caches when this command is issued. The PIPE_CONTROL restrictions are removed.			
Programming Notes			
Restriction: Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set, followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH).			
The stencil buffer is always Tile-W			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	Command SubType	
		Default Value:	3h GFXPIPE_3D

		3DSTATE_STENCIL_BUFFER	
1	31	Stencil Buffer Enable	
		Project:	BDW
		Format:	U1
		When set indicates that there is a valid stencil buffer.	
		Programming Notes	
	This bit should be "0" if Depth buffer surface format is D16_UNORM OR Depth buffer surface type is NULL.		
	30:29	Reserved	
		Format:	MBZ
	28:22	Stencil Buffer Object Control State	
		Project:	BDW
		Format:	MEMORY_OBJECT_CONTROL_STATE
	Specifies the memory object control state for the stencil buffer.		
	21:17	Reserved	
		Format:	MBZ
	16:0	Surface Pitch	
		Format:	U17-1 Pitch in Bytes
	This field specifies the pitch of the stencil buffer in (#Bytes - 1).		
		Value	Name
		[127, 1FFFFh]	corresponding to [128B, 128KB]also restricted to a multiple of 128B
	Programming Notes		
	Since this surface is tiled, the pitch specified must be a multiple of the tile pitch, in the range [128B, 128KB].		
	The pitch must be set to 2x the value computed based on width, as the stencil buffer is stored with two rows interleaved. For details on the separate stencil buffer storage format in memory, see GPU Overview (vol1a), Memory Data Formats, Surface Layout, 2D Surfaces, Stencil Buffer Layout (section 8.20.4.8).		
2..3	63:0	Surface Base Address	
		Project:	BDW
		Format:	GraphicsAddress[63:0]Stencil_Buffer
	This field specifies the address of the buffer in Graphics Memory.		
	Programming Notes		
	The Stencil Buffer can only be mapped to Main Memory (uncached).		
4	31:15	Reserved	
		Project:	BDW
		Format:	MBZ

3DSTATE_STENCIL_BUFFER

14:0	Surface QPitch	
	Project:	BDW
	Format:	QPitch[16:2]
	Description	
	<p>This field specifies the distance in rows between array slices. It is used only in the following cases:</p> <ul style="list-style-type: none"> • Surface Array is enabled <i>OR</i> • Number of Multisamples is not NUMSAMPLES_1 and Multisampled Surface Storage Format set to MSFMT_MSS <i>OR</i> • Surface Type is SURFTYPE_CUBE 	
	Value	Name
	[4h,1FFFCh]	
	Description	
	in multiples of 4 (low 2 bits missing)	
	Programming Notes	
<p>This field must be set to an integer multiple of 8 (QPitch[2] MBZ) Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.</p>		

3DSTATE_STREAMOUT

3DSTATE_STREAMOUT			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
This command contains pipelined state required by the SOL unit.			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	Command SubType	
		Default Value:	3h GFXPIPE_3D
		Format:	OpCode
	26:24	3D Command Opcode	
		Default Value:	0h 3DSTATE_PIPELINED
		Format:	OpCode
	23:16	3D Command Sub Opcode	
Default Value:		1Eh 3DSTATE_STREAMOUT	
Format:		OpCode	
15:8	Reserved		
	Project:	All	
	Format:	MBZ	
7:0	DWord Length		
	Default Value:	3h Excludes DWord (0,1)	
	Project:	BDW	
	Format:	=n Total Length - 2	
1	31	SO Function Enable	
		Project:	All
		Format:	U1
If set, the SO function is enabled. Vertex data will be streamed out to memory (subject to overflow detection) as controlled by the various SO-related state variables. If clear, the SO function is disabled, and therefore no vertex data will be streamed out to memory. However, the Rendering Disable and Render Stream Select fields will still be used to determine which vertices (if any) are forwarded down the pipeline for (possible) rendering.			

3DSTATE_STREAMOUT		
30	API Rendering Disable	
	Project:	BDW
	Format:	U1
<p>If set, Indicates the API wants the SO stage not to forward any topologies down the pipeline. If clear, Indicates the API wants the SO stage to forward topologies associated with Render Stream Select down the pipeline. This bit is used even if SO Function Enable is DISABLED.</p>		
Programming Notes		
<p>The SOL unit generates an SOL_INT::Render_Enable which ultimately controls whether rendering occurs or not.</p>		
29	Reserved	
	Project:	All
	Format:	MBZ
28:27	Render Stream Select	
	Project:	All
	Format:	U2
Description		
<p>This field specifies which stream has been selected to be forwarded down the pipeline for possible rendering. Topologies from other streams will not be passed down the pipeline. If Rendering Disable is set, this field is ignored, as no topologies are sent down the pipeline.</p>		
<p>SO Function Enable must also be ENABLED in order for this field to select a stream for rendering. When SO Function Enable is DISABLED and Rendering Disable is cleared (i.e., rendering is enabled), StreamID is ignored downstream of the SO stage, allowing any stream to be rendered.</p>		
26	Reorder Mode	
	Project:	All
<p>This bit controls how vertices of triangle objects in TRISTRIP[_ADJ] and TRISTRIP_REV are reordered for the purposes of stream-out only (does not impact rendering). See table in Input Buffering.</p>		
	Value	Name Description
	0h	LEADING Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the leading (first) vertices are in consecutive order starting at v0. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.
	1h	TRAILING Reorder the vertices of alternating triangles of a TRISTRIP[_ADJ] such that the trailing (last) vertices are in consecutive order starting at v2. A similar reordering is performed on alternating triangles in a TRISTRIP_REV.

15:14	Reserved	
	Project:	All
	Format:	MBZ
13:12	Partitioning	
	Project:	All
	Format:	U2
This field specifies how edges are partitioned based on tessellation factor.		
	Value	Name Description
	0h	INTEGER Outside/inside edges are divided into an integer number of equal-sized segments.
	1h	ODD_FRACTIONAL Outside/inside edges are divided into an odd number of possibly-unequal-sized segments.
	2h	EVEN_FRACTIONAL Outside/inside edges are divided into an even number of possibly-unequal-sized segments.
11:10	Reserved	
	Project:	All
	Format:	MBZ
9:8	Output Topology	
	Project:	All
	Format:	U2
This field specifies which primitive types are to be output.		
	Value	Name Description
	0h	POINT Points are output (as POINTLIST topologies)
	1h	LINE Lines are output (as LINESTRIP topologies). Only valid if ISOLINE domain is selected.
	2h	TRI_CW Clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.
	3h	TRI_CCW Count-clockwise-ordered triangles are output (either as TRISTRIP, TRISTRIP_REV or TRILIST topologies). Not valid if ISOLINE domain is selected.
7:6	Reserved	
	Project:	All
	Format:	MBZ

3DSTATE_TE			
5:4	TE Domain		
	Project:	All	
	Format:	U2	
	This field specifies which type of domain is to be tessellated.		
	Value	Name	Description
	0h	QUAD	2D (U, V) domain is tessellated
	1h	TRI	Triangular (U, V, W) domain is tessellated
	2h	ISOLINE	2D (U, V) domain is tessellated.
	3	Reserved	
		Project:	All
Format:		MBZ	
2:1	TE Mode		
	Project:	All	
	Format:	U2	
	When TE Enable is ENABLED, this field specifies the overall operation of the TE stage. This field is ignored if TE Enable is DISABLED.		
	Value	Name	Description
	0h	HW_TESS	Normal HW Tessellation Mode. The TessFactors are read from the patch URB entry, and are used to perform fixed-function hardware tessellation of the specified domain.
	1h	SW_TESS	Software Tessellation Mode. The TE unit will pass down HS-thread-generated tessellated domain points instead of generating them itself from TessFactors. The TE unit will read the Domain Point Count and Domain Point Buffer Starting Address fields from the patch header, and if the count is 0 it will consider the patch culled and discard it. Otherwise the address is used to start fetching DOMAIN_POINT structures from memory and passing them down the pipeline to DS.
	0	TE Enable	
		Project:	All
Format:		Enable	
If ENABLED, the TE stage will perform tessellation processing on incoming patch primitives. The TE Mode field determines how this tessellation operation proceeds. If DISABLED, the TE goes into pass-through mode. All other state fields are ignored.			
Programming Notes			
The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.			

3DSTATE_TE								
2	31:0	Maximum Tessellation Factor Odd Format: IEEE_Float This field specifies the maximum TessFactor for ODD_FRACTIONAL partitioning when in HW_TESS mode.						
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[427c0000h,427c0000h]</td> <td style="text-align: center;">63 [Default]</td> <td>Per API Spec, For normal operation software should set this value to 63.0</td> </tr> </tbody> </table>	Value	Name	Description	[427c0000h,427c0000h]	63 [Default]	Per API Spec, For normal operation software should set this value to 63.0

Format: U9-1 count of 512-bit units										
Specifies the length of each URB entry owned by VS. This field is always used (even if VS Function Enable is DISABLED).										
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Value</th> <th style="width: 30%;">Name</th> <th style="width: 40%;">Project</th> </tr> </thead> <tbody> <tr> <td>[0,9]</td> <td></td> <td>BDW</td> </tr> </tbody> </table>		Value	Name	Project	[0,9]		BDW			
Value		Name	Project							
[0,9]		BDW								
Programming Notes										
Programming Restriction: As the VS URB entry serves as both the per-vertex input and output of the VS shader, the VS URB Allocation Size must be sized to the maximum of the vertex input and output structures.										
15:0	VS Number of URB Entries									
	Project: All									
	Format: U16									
	Specifies the number of URB entries that are used by VS. This field is always used (even if VS Function Enable is DISABLED).									
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Value</th> <th style="width: 30%;">Name</th> <th style="width: 40%;">Project</th> </tr> </thead> <tbody> <tr> <td>[64,2560]</td> <td></td> <td>BDW</td> </tr> </tbody> </table>	Value	Name	Project	[64,2560]		BDW			
	Value	Name	Project							
	[64,2560]		BDW							
Programming Notes										
Programming Restriction: VS Number of URB Entries must be divisible by 8 if the VS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000b"										
When tessellation is enabled, the VS Number of URB Entries must be greater than or equal to 192.										

3DSTATE_VERTEX_BUFFERS

3DSTATE_VERTEX_BUFFERS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
This command is used to specify VB state used by the VF function.			
Can specify from 1 to 33 VBs.			
The VertexBufferID field within a VERTEX_BUFFER_STATE structure indicates the specific VB. If a VB definition is not included in this command, its associated state is left unchanged and is available for use if previously defined.			
Programming Notes			
It is possible to have individual vertex elements sourced completely from generated ID values and therefore not require any vertex buffer accesses for that vertex element. In this case, VF function will simply ignore the VB state associated with that vertex element. If all enabled vertex elements have this characteristic, no VBs are required to process 3DPRIMITIVE commands. For example, this might arise when the user wants to perform all data lookups in the first shader, so only generated index values need to be passed down to it. In this extreme case, SW would not need to program any VB state, and therefore not need to issue any 3DSTATE_VERTEX_BUFFERS commands.			
For any 3DSTATE_VERTEX_BUFFERS command, at least one VERTEX_BUFFER_STATE structure must be included.			
VERTEX_BUFFER_STATE structures are 4 DWords for both VERTEXDATA buffers and INSTANCEDATA buffers.			
Inclusion of partial VERTEX_BUFFER_STATE structures is UNDEFINED.			
The order in which VBs are defined within this command can be arbitrary, though a vertex buffer must be defined only once in any given command (otherwise operation is UNDEFINED).

3DSTATE_VERTEX_ELEMENTS

3DSTATE_VERTEX_ELEMENTS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
Description			
This is a variable-length command used to specify the active vertex elements. Each VERTEX_ELEMENT_STATE structure contains a Valid bit which determines which elements are used. Up to 34 elements.			
Programming Notes			
At least one VERTEX_ELEMENT_STATE structure must be included.			
The 3DSTATE_VERTEX_ELEMENTS must not be programmed more than once before each 3DPRIMITIVE command.			
Inclusion of partial VERTEX_ELEMENT_STATE structures is UNDEFINED.			
SW must ensure that at least one vertex element is defined prior to issuing a 3DPRIMITIVE command, or operation is UNDEFINED.			
There are no 'holes' allowed in the destination vertex: NOSTORE components must be overwritten by subsequent components unless they are the trailing DWords of the vertex. Software must explicitly chose some value (probably 0) to be written into DWords that would otherwise be 'holes'.			
Within a VERTEX_ELEMENT_STATE structure, if a Component Control field is set to something other than VFCOMP_STORE_SRC, no higher-numbered Component Control fields may be set to VFCOMP_STORE_SRC. In other words, only trailing components can be set to something other than VFCOMP_STORE_SRC.			
See additional restrictions listed in the command fields and VERTEX_ELEMENT_STATE description.			
Element[0] must be valid.			
All elements must be valid from Element[0] to the last valid element. (I.e. if Element[2] is valid then Element[1] and Element[0] must also be valid).			
The pitch between elements packed in the URB will always be 128 bits.

Format:	U6												
Value	Name												
[0,33]													
2	31:0	<p>Instance Data Step Rate</p> <p>If Instancing Enable is ENABLED, this field determines the rate at which data for this particular vertex element is changed between instances. Only after the number of instances specified by this field is generated is new (sequential) vertex element data provided. This process continues for each group of instances defined in the 3DPRIMITIVE command. For example, a value of 1 in this field causes new data to be supplied for this vertex element with each sequential (instance) group of vertices. A value of 2 causes every other instance group of vertices to be provided with new vertex element data. The special value of 0 causes all vertices of all instances generated by the 3DPRIMITIVE command to be provided with the same data for this vertex element. (The same effect can be achieved by setting this field to its maximum value.) If Instancing Enable is DISABLED, this field is ignored.</p>											

3DSTATE_VF_SGVS

3DSTATE_VF_SGVS			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
<p>This command is used to control the insertion of the VertexID and InstanceID System-Generated Values (SGVs) into an input Vertex URB Entry (VUE) (available as input to a VS thread). VertexID and InstanceID insertion can be individually controlled. The insertion locations are specified as 128-bit element locations (starting at the beginning of the VUE) and the 32-bit component within those specified elements. The SGV values can be inserted either (a) within a valid vertex element (in which case the value overwrites the value specified via 3DSTATE_VERTEX_ELEMENTS) or (b) beyond the last valid vertex element written to the URB. This permits some orthogonality between the programming of vertex elements (which typically is known at draw time) and programming of SGV insertion (which is associated with the shader). There are some restrictions however (see below). If an SGV is inserted beyond the last valid vertex element, zeroes are first inserted in the VUE after the last valid vertex element up to and including the vertex element receiving an SGV. If both of the SGVs are enabled for insertion, the zeroes will extend to the last (largest index) vertex element receiving an SGV. Then the SGV(s) are inserted.</p>			
Programming Notes			
Programming Restrictions:			
<ul style="list-style-type: none"> It is INVALID to store both the VertexID and InstanceID in the same element/component location within the VUE. The states programmed by this command overwrite the state programmed by any previous commands. I.e., VertexID and InstanceID (if enabled) can only be inserted in one component of a vertex. It is INVALID to insert an SGV value past the end of the VUE entry (as determined by VS URB Entry Allocation Size) or past the 33rd vertex element. Therefore the programming of VS URB Entry Allocation Size needs to comprehend any SGV insertion requirements. It is INVALID to use this command to overwrite any portion of a 64-bit vertex element component. It is INVALID to use this command to overwrite a EdgeFlag vertex element component or any vertex element beyond it.

3DSTATE_VS			
25:18	Binding Table Entry Count		
	Project:	All	
	Format:	U8	
	Description		
	<p>Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.</p> <p>Note: For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.</p> <p>This field is ignored if VS Function Enable is DISABLED.</p> <p>When HW Generated Binding Table bit is enabled: This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.</p>		
	Value	Name	
	[0,255]		
	Programming Notes		
	When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.		
	17	Thread Dispatch Priority	
Project:		All	
Format:		U1 Enumerated Type	
Specifies the priority of the thread for dispatch: This field is ignored if VS Function Enable is DISABLED.			
Value		Name	Description
0h	Normal	Normal Priority	
1h	High	High Priority	
16	Floating Point Mode		
	Format:	U1 Enumerated Type	
	Specifies the initial floating point mode used by the dispatched thread. This field is ignored if VS Function Enable is DISABLED.		
	Value	Name	Description
	0h	IEEE-754	Use IEEE-754 Rules
1h	Alternate	Use Alternate Rules	
15:14	Reserved		
	Format:	MBZ	

3DSTATE_VS					
	13	Illegal Opcode Exception Enable	Project: All	Format: Enable	This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.
	12	Accesses UAV	Format: Enable	This field must be set when VS has a UAV access.	
	Programming Notes				
	This field must not be set when VS Function Enable is disabled.				
	Workaround: If the vertex shader is the last shader to have UAV access, a PIPE_CONTROL with CS_STALL must be sent before the 3dprimitive using the UAV access.				
	11:8	Reserved	Project: All	Format: MBZ	
	7	Software Exception Enable	Project: All	Format: Enable	This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.
	6:0	Reserved	Project: All	Format: MBZ	
4.5	63:10	Scratch Space Base Pointer	Project: All	Format: GeneralStateOffset[63:10]ScratchSpace	Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED. In 64b OS all pointers need to be seen by SW as 48b. HW does not support a Scratch Space Base Pointer larger than 32b, therefore SW must ensure the scratch space base offset upper is set to 0's. But the DWORD must be in the command for SW to right the pointer to.
	9:4	Reserved	Project: All	Format: MBZ	

3DSTATE_VS		
3:0	Per-Thread Scratch Space	
	Project:	All
	Format:	U4 power of 2 Bytes over 1K Bytes
	<p>Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if VS Function Enable is DISABLED.</p>	
	Value	Name
	[0,11]	Indicating [1K Bytes, 2M Bytes]
	Programming Notes	
	<p>This amount is available to the kernel for information only. It will be passed verbatim (if not altered by the kernel) to the Data Port in any scratch space access messages, but the Data Port will ignore it.</p>	
	Reserved	
	Format:	MBZ
6	Reserved	
	Format:	MBZ
	Dispatch GRF Start Register For URB Data	
	Project:	All
	Format:	U5
	<p>Specifies the starting GRF number for the URB portion (URB constants and vertices) of the thread payload. This field is ignored if VS Function Enable is DISABLED.</p>	
	Value	Name
	[0,31]	indicating GRF [R0, R31]
	Reserved	
	Format:	MBZ
16:11	Vertex URB Entry Read Length	
	Format:	U6
	<p>Specifies the number of pairs of 128-bit vertex elements to be passed into the payload for each vertex. This field is ignored if VS Function Enable is DISABLED. For SIMD4x2 dispatch, each vertex element requires one GRF of payload data, therefore the number of GRFs with vertex data will be double the value programmed in this field. For SIMD8 dispatch, each vertex element requires 4 GRFs of payload data, therefore the number of GRFs with vertex data will be 8 times the value programmed in this field. The EU limit of 128 GRFs imposes a maximum limit of 30 elements per vertex pushed into the payload, though the practical limit may be lower. If input vertices exceed the practical limit, software must decide between resorting to pulling elements during thread execution or dropping back to SIMD4x2 dispatch. Note that the VUE is used for both input and output, so when using the pull-model software must ensure inputs are not overwritten before last use.</p>	
	Value	Name
	[1,63]	if SIMD8 dispatch disabled
	[0,15]	if SIMD8 dispatch enabled

3DSTATE_WM_DEPTH_STENCIL	
0	Depth Buffer Write Enable
	Project: All
	Format: Enable
	Enables writes to the Depth Buffer.
	Programming Notes
	A Depth Buffer must be defined before enabling writes to it, or operation is UNDEFINED.
	This bit must not be set when WM_INT::RT Independent Rasterization Enable is true.
	Workaround
	If Depth_Test_Enable = 1 AND Depth_Test_func = EQUAL, the Depth_Write_Enable must be set to 0.
	2
Stencil Test Mask	
Project: All	
Format: U8	
This field specifies a bit mask applied to stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.	
23:16	Stencil Write Mask
Project: All	
Format: U8	
This field specifies a bit mask applied to stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.	
15:8	Backface Stencil Test Mask
Project: All	
Format: U8	
This field specifies a bit mask applied to backface stencil test values. Both the stencil reference value and value read from the stencil buffer will be logically ANDed with this mask before the stencil comparison test is performed.	
7:0	Backface Stencil Write Mask
Project: All	
Format: U8	
This field specifies a bit mask applied to backface stencil buffer writes. Only those stencil buffer bits corresponding to bits set in this mask will be modified.

1	31	Statistics Enable	
		Project:	All
		Format:	Enable
	<p>If ENABLED, the Windower and pixel pipeline will engage in statistics gathering. If DISABLED, statistics information associated with this FF stage will be left unchanged. See Statistics Gathering.</p>		
	<p style="text-align: center;">Programming Notes</p> <p>This bit must be disabled if any of these bits is set: 3DSTATE_WM::Legacy Depth Buffer Clear, 3DSTATE_WM::Legacy Hierarchical Depth Buffer Resolve Enable or 3DSTATE_WM::Legacy Depth Buffer Resolve Enable.</p>		

3DSTATE_WM

30	Legacy Depth Buffer Clear Enable		
	Project:	All	
	Format:	Enable	
When set, the depth buffer is initialized as a side-effect of rendering pixels.			
Programming Notes			
If this field is enabled,			
<ol style="list-style-type: none"> 1. The Depth Test Enable field in DEPTH_STENCIL_STATE must be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set. 3. 3DSTATE_DEPTH_BUFFER::Stencil Write Enable must be set if 3DSTATE_STENCIL_BUFFER::Stencil buffer enable is set. Additionally the following must be set to the correct values. <ol style="list-style-type: none"> 1. DEPTH_STENCIL_STATE::Stencil Write Mask must be 0xFF 2. DEPTH_STENCIL_STATE::Stencil Test Mask must be 0xFF 3. DEPTH_STENCIL_STATE::Back Face Stencil Write Mask must be 0xFF 4. DEPTH_STENCIL_STATE::Back Face Stencil Test Mask must be 0xFF 			
Refer to section 0 "Depth Buffer Clear" for additional restrictions when this field is enabled. If this field is enabled, Pixel Shader Kill Pixel must be disabled.			
29	Reserved		
	Project:	All	
	Format:	MBZ	
28	Legacy Depth Buffer Resolve Enable		
	Project:	All	
	Format:	Enable	
When set, the depth buffer is made to be consistent with the hierarchical depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer is to be used as a surface outside of the 3D rendering operation.			
Programming Notes			
If this field is enabled,			
<ol style="list-style-type: none"> 1. The Legacy Depth Buffer Clear and Legacy Hierarchical Depth Buffer Resolve Enable fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set. 			
Refer to section 11.5.4.2 "Depth Buffer Resolve" for additional restrictions when this field is enabled. If Hierarchical Depth Buffer Enable is disabled, enabling this field will have no effect.

3DSTATE_WM

22:21	Early Depth/Stencil Control	
Project:		BDW
Format:		U2 Enumerated Type
This field specifies the behavior of early depth/stencil test.		
Value	Name	Description
0h	NORMAL	Depth/Stencil Test/Write behaves as if it happens post-shader, however the pixel shader is not necessarily executed if the pixel fails depth or stencil test (this is the legacy behavior)
1h	PSEEXEC	Depth/Stencil Test/Write behaves as if it happens post-shader, and the pixel shader is executed if the pixel fails depth or stencil test (although pre-shader actions such as primitive inclusion, stipple, etc. will still cause the shader not to execute)
2h	PREPS	Depth/Stencil Test/Write behaves as if it happens pre-shader. The pixel shader is not executed if the pixel fails depth or stencil test. Depth and stencil writes occur even if the pixel is killed by the shader or post-shader by alpha test, etc. Depth output by the pixel shader is ignored.
3h	Reserved	
Programming Notes		
The Early Depth/Stencil Control field cannot be set to PREPS (value = 2h) if ForceKillpix = ForceON or Forced Thread Dispatch = ForceON		
20:19	Force Thread Dispatch Enable	
Project:		All
Value	Name	Description
0h	Normal	WM_INT::ThreadDispatchEnable is computed normally
1h	ForceOff	Forces WM_INT::ThreadDispatchEnable Off
2h	ForceON	Forces WM_INT::ThreadDispatchEnable On
3h	Reserved	
Programming Notes		
This must always be set to Normal. This field should not be tested for functional validation		

3DSTATE_WM			
18:17	Position ZW Interpolation Mode		
	Project:	All	
	Format:	U2 Enumerated Type	
	<p>This field elects "interpolation mode" associated with the Position Z (source depth) and W coordinates passed in the PS payload when the PS requires Position as input. This field does not determine whether these coordinates are actually included in the payload (see Pixel Shader Requires Depth, Pixel Shader Requires W).</p>		
	Value	Name	Description
	0h	INTERP_PIXEL	Evaluate Z & W at the pixel center or UL corner (as specified by Pixel Location of 3DSTATE_MULTISAMPLE)
	1h	Reserved	
	2h	INTERP_CENTROID	
	3h	INTERP_SAMPLE	
	Programming Notes		
<p>WM_INT::RT Independent Rasterization Enable must be disabled in order to select INTERP_SAMPLE.</p> <p>MSDISPMODE_PERSAMPLE is required in order to select INTERP_SAMPLE.</p>			
16:11	Barycentric Interpolation Mode		
	Project:	All	
	Format:	Enable[6]	
	<p>Controls which barycentric interpolation terms must be passed into the pixel shader kernel. Bit 0: Perspective Pixel Location barycentric is required Bit 1: Perspective Centroid barycentric is required Bit 2: Perspective Sample barycentric is required Bit 3: Non-perspective Pixel Location barycentric is required Bit 4: Non-perspective Centroid barycentric is required Bit 5: Non-perspective Sample barycentric is required</p>		
	Programming Notes		
<p>If contiguous dispatch modes are enabled, only bit 3 (non-perspective pixel location) can be set, all other bits in this field must be zero. Pixel Location below refers to either the upper left corner or pixel center depending on the Pixel Location state of 3DSTATE_MULTISAMPLING). MSDISPMODE_PERSAMPLE is required in order to select Perspective Sample or Non-perspective Sample barycentric coordinates.</p>			
10	Reserved		
	Project:	All	
	Format:	MBZ	

3DSTATE_WM			
9:8	Line End Cap Antialiasing Region Width		
	Project:	All	
	Format:	U2	
	This field specifies the distances over which the coverage of anti-aliased line end caps are computed.		
	Value	Name	Description
	0h	0.5 pixels	0.5 pixels
	1h	1.0 pixels	1.0 pixels
	2h	2.0 pixels	2.0 pixels
	3h	4.0 pixels	4.0 pixels
	7:6	Line Antialiasing Region Width	
Project:		All	
Format:		U2	
This field specifies the distance over which the anti-aliased line coverage is computed.			
Value		Name	Description
0h		0.5 pixels	0.5 pixels
1h		1.0 pixels	1.0 pixels
2h		2.0 pixels	2.0 pixels
3h		4.0 pixels	4.0 pixels
5		Reserved	
	Project:	All	
	Format:	MBZ	
4	Polygon Stipple Enable		
	Project:	All	
	Format:	Enable	
Enables the Polygon Stipple function.			
3	Line Stipple Enable		
	Project:	All	
	Format:	Enable	
Enables the Line Stipple function.			

3DSTATE_WM			
2	Point Rasterization Rule		
	Project:	All	
	Format:	3D_RasterizationRule	
	This field specifies the rasterization rules to be applied whenever the edges of a point primitive fall exactly on a pixel sampling point.		
	Value	Name	Description
	0h	RASTRULE_UPPER_LEFT	To match "normal" upper left rules for surface primitives
	1h	RASTRULE_UPPER_RIGHT	To match OpenGL point rasterization rules (round to + infinity, where this is the upper right direction wrt OpenGL screen origin of lower left).
	Force Kill Pixel Enable		
	Project:	All	
	Value	Name	Description
0h	Normal	WM_INT:: Pixel Shader Kill Pixel is computed normally	
1h	ForceOff	Forces WM_INT:: Pixel Shader Kill Pixel Off	
2h	ForceON	Forces WM_INT:: Pixel Shader Kill Pixel On	
3h	Reserved		
Programming Notes			
This must always be set to Normal. This field should not be tested for functional validation			
1:0			

3DSTATE_WM_HZ_OP

3DSTATE_WM_HZ_OP		
Project:	BDW	
Source:	RenderCS	
Length Bias:	2	
This command provides for clearing Z and/or stencil or resolving either HZ buffer or Z buffer.		
Programming Notes		
3DSTATE_MULTISAMPLE packet must be used prior to this packet to change the Number of Multisamples. This packet must not be used to change Number of Multisamples in a rendering sequence. 3DSTATE_RASTER if used must be programmed prior to using this packet.		
This command does support predication from the use of the MI_PREDICATE register. To predicate depth clears and resolves on [BDW], you must fall back to using the 3D_PRIMITIVE or GPGPU_WALKER commands.		
As this command generates an implicit rectangle, SW must make sure any MMIO register writes following WM_HZ_OP must be preceded by PIPE_CONTROL with Command Streamer Stall Enable bit set.		
DWord	Bit	Description
0	31:29	Command Type
		Default Value: 3h GFXPIPE

This is intended to be used when the depth buffer has been modified outside of the 3D rendering operation.</p> <div style="background-color: #e6f2ff; text-align: center; padding: 2px;">Programming Notes</div> <p>If this field is enabled,</p> <ol style="list-style-type: none"> 1. the Depth Buffer Clear and Depth Buffer Resolve Enable fields must both be disabled. 2. 3DSTATE_DEPTH_BUFFER::Depth Write Enable must be set. <p>Refer to section 11.5.4.3 "Hierarchical Depth Buffer Resolve" for additional restrictions when this field is enabled. If Hierarchical Depth Buffer Enable is disabled, enabling this field will have no effect. Performance Note: expect the hierarchical depth buffer's impact on performance to be reduced for some period of time after this operation is performed, as the hierarchical depth buffer is initialized to a state that makes it ineffective. Further rendering will tend to bring the hierarchical depth buffer back to a more effective state.</p>	Project:	All	Format:	Enable

26	<p>Pixel Position Offset Enable</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U1 Enumerated Type</td> </tr> </table> <p>Enables the device to offset pixel positions by 0.5 both in horizontal and vertical directions.</p> <table border="1" style="width: 100%; background-color: #e6f2ff;"> <tr> <th style="text-align: center;">Programming Notes</th> </tr> </table> <p>Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel positions by 0.5 both in horizontal and vertical directions. It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any WM_HZ_OP screen space rectangles (eg: legacy HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration. SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.</p>	Project:	All	Format:	U1 Enumerated Type	Programming Notes

Addition

add - Addition			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
The add instruction performs component-wise addition of src0 and src1 and stores the results in dst. Addition of two floating-point numbers follows rules in add (IEEE mode) or add (ALT mode).			
Format: [(pred)] add[.cmod] (exec_size) dst src0 src1			
Programming Notes			
Use a source modifier with add to implement subtraction.			
Syntax			
[(pred)] add[.cmod] (exec_size) reg reg reg [(pred)] add[.cmod] (exec_size) reg reg imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] + src1.chan[n]; } }

Addition with Carry

addc - Addition with Carry			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The addc instruction performs component-wise addition of src0 and src1 and stores the results in dst; it also stores the carry into acc. If the operation produces a carry out, 0x00000001 is stored in acc, else 0x00000000 is stored in acc.</p>			
<p>Format: [(pred)] addc[.cmod] (exec_size) dst src0 src1</p>			
Restriction			
<p>AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.</p>			
Syntax			
<p>[(pred)] addc[.cmod] (exec_size) reg reg reg [(pred)] addc[.cmod] (exec_size) reg reg imm32</p>			
Pseudocode			
<p>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] + src1.chan[n]; acc.chan[n] = carry(src0.chan[n] + src1.chan[n]); } }</p>

Arithmetic Shift Right

asr - Arithmetic Shift Right			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>Perform component-wise arithmetic right shift of the bits in src0 by the shift count indicated in src1, storing the results in dst. If src0 has a signed type, insert copies of src0's sign bit in the number of MSBs indicated by the shift count. Otherwise insert 0 bits. In QWord mode, the shift count is taken from the low six bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 63. Otherwise the shift count is taken from the low five bits of src1 regardless of the src1 type and treated as an unsigned integer in the range 0 to 31. The operation uses QWord mode if src0 or dst has the Q or UQ type but not if src1 is the only operand with the Q or UQ type. For positive values, this operation is $src0 / 2^{shiftCount}$ and for negative values, this operation is $src0 / 2^{shiftCount} - 1$. Format: [(pred)] asr[.cmod] (exec_size) dst src0 src1</p>			
Programming Notes			
If src0 is -1, the result is -1 regardless of the shift count.			
For unsigned src0 types, asr and shr produce the same result.			
Syntax			
[(pred)] asr[.cmod] (exec_size) reg reg reg [(pred)] asr[.cmod] (exec_size) reg reg imm32			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.channel[n]) { shiftCnt = src0 or dst has Q or UQ type ? src1.chan[n] & 0x3F : src1.chan[n] & 0x1F if (src0.chan[n] >= 0) { dst.chan[n] = src0.chan[n] » shiftCnt; } else { int maskLSB = pow(2, shiftCnt) - 1; if (maskLSB & src0.chan[n] == 0) { dst.chan[n] = sign(src0.chan[n]) * ((abs)src0.chan[n] » shiftCnt); } else { dst.chan[n] = sign(src0.chan[n]) * ((abs)src0.chan[n] » shiftCnt) - 1; } } }</pre>

Bit Field Extract

bfe - Bit Field Extract			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>Component-wise extract a bit field from src2 using the bit field width from src0 and the bit field offset from src1. Store the extracted bit field value in the low bits of dst and sign extend (if D type) or zero extend (if UD type). The width and offset values are from the low five bits of src0 and src1 respectively, or src0 & 0x1f and src1 & 0x1f. If width is zero, the result is zero. If offset + width > 32 then the extracted bit field is bits offset to 31 of src2, extracting only 32 - offset bits, less than width as the bit field cannot extend past the MSB of the source value. Otherwise extract width bits extending from bit positions offset to offset + width - 1.</p>			
Format: [(pred)] bfe (exec_size) dst src0 src1 src2			
Restriction			Project
No accumulator access, implicit or explicit.			
All three-source instructions have certain restrictions, described in Instruction Formats [BDW].			BDW
Syntax			
[(pred)] bfe (exec_size) reg reg reg reg			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { UD width = src0.chan[n][4:0]; UD offset = src1.chan[n][4:0]; if (width == 0) { dst.chan[n] = 0x00000000; } else if ((width + offset) < 32) { dst.chan[n] = src2.chan[n] << (32 - width - offset); if (src2 is signed) { dst.chan[n] = dst.chan[n] >> (32 - width); // pad sign bit of dst.chan } else { dst.chan[n] = dst.chan[n] >> (32 - width); // pad 0 } } else { if (src2 is signed) { dst.chan[n] = src2.chan[n] >> offset; // pad sign bit } else { dst.chan[n] = src2.chan[n] >> offset; // pad 0 } } }</pre>

Bit Field Insert 1

bfi1 - Bit Field Insert 1			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The bfi1 instruction is the first instruction in a two-instruction macro for bfi (Bit Field Insert). The bfi1 instruction component-wise generates mask with control from src0 and src1 and stores the results in dst. The mask is used in the bfi2 instruction to generate the final result of bfi. Create a bit mask corresponding to the bit field width and offset in src0 and src1. Store the bit mask in dst. The mask has all bits in the bit field set to 1 and all other bits as 0. The width and offset values are from the low five bits of src0 and src1 respectively, or src0 & 0x1f and src1 & 0x1f. If width is zero, the result is zero. The bfi macro has four source operands: src0 - bit field width in low five bits, src1 - bit field offset/starting bit position in low five bits, src2 - bit field value to insert, using only the number of least significant bits given by width in src0, and src3 - overall value into which the bit field is inserted, providing all bits other than the inserted bits for the result value. bfi dst src0 src1 src2 src3 //</p> <p>Translates to these two instructions: bfi1 dst src0 src1 bfi2 dst dst src2 src3</p>			
Format: [(pred)] bfi1 (exec_size) dst src0 src1			
Programming Notes			
No accumulator access, implicit or explicit.

Bit Field Insert 2

bfi2 - Bit Field Insert 2			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The bfi2 instruction is the second instruction in a two-instruction macro for bfi (Bit Field Insert). The bfi2 instruction component-wise performs the bitfield insert operation on src1 and src2 based on the mask in src0. Use the mask in src0 to take a bit field value from the low bits of src1 and combine it with the value from src2 (so src2 provides all bits other than those masked out and replaced by the bit field value). Store the result in dst. The bfi macro has four source operands: src0 - bit field width in low five bits, src1 - bit field offset/starting bit position in low five bits, src2 - bit field value to insert, using only the number of least significant bits given by width in src0, and src3 - overall value into which the bit field is inserted, providing all bits other than the inserted bits for the result value. bfi dst src0 src1 src2 src3 // Translates to these two instructions: bfi1 dst src0 src1 bfi2 dst dst src2 src3</p>			
Format: [(pred)] bfi2 (exec_size) dst src0 src1 src2			
Restriction			
No accumulator access, implicit or explicit.			
All three-source instructions have certain restrictions, described in Instruction Formats [BDW].			
Syntax			
[(pred)] bfi2 (exec_size) reg reg reg reg			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { UD offset = LZD(reverse(src0.chan[n]))-1; // offset is the number of LSB zero bits below the bit mask which has all 1s. // width (implied by the logic) is the number of 1 bits in the mask value, which should be all 1s. dst.chan[n] = ((src1.chan[n] << offset) & src0.chan[n]) (src2.chan[n] & ! src0.chan[n]); }</pre>

Branch Converging

brc - Branch Converging				
Project:	BDW			
Source:	EuIsa			
Length Bias:	4			
Description				
<p>The brc instruction redirects the execution forward or backward to the instruction pointed by (current IP + offset). The jump will occur if all channels are branched away. UIP should reference the instruction where all channels are expected to come together. JIP should reference the end of the innermost conditional block.</p> <p>In GEN binary, JIP and UIP use locations src1 and src0 respectively when immediate and location src0 when reg64, where reg64 is accessed as paired DWord (regioning being <2;2,1>). dst must be IP. When the offsets are immediate, src0 regfile must be immediate.</p> <p>Format: [(pred)] brc (exec_size) JIP UIP</p>				
Restriction	Project

Break

break - Break							
Project:	BDW						
Source:	EuIsa						
Length Bias:	4						
Description							
<p>The break instruction is used to early-out from the inner most loop, or early out from the inner most switch block. When used in a loop, upon execution, the break instruction terminates the loop for all execution channels enabled. If all the enabled channels hit the break instruction, jump to the instruction referenced by JIP. JIP should be the offset to the end of the inner most conditional or loop block, UIP should be the offset to the while instruction of the loop block. If SPF is ON, the UIP must be used to update IP; JIP is not used in this case</p> <p>The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate.</p> <p>Format: [(pred)] break (exec_size) JIP UIP</p>							
Syntax							
[(pred)] break (exec_size) imm16 imm16

Call

call - Call			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The call instruction jumps to a subroutine. It can be predicated or non-predicated. If non-predicated, all enabled channels jump to the subroutine. If predicated, only the channels enabled by PMask jump to the subroutine; the rest of the channels move to the next instruction after the call instruction. If none of the channels jump into the subroutine, the call instruction is treated as a nop. In case of a jump, the call instruction stores the return IP onto the first DWord of the destination register and stores the CallMask in the second DWord of the destination register. When SPF is on, the predication control must be scalar.</p> <p>The following table describes JIP, the jump offset. JIP can be an immediate or register value. When a jump occurs, this value is added to IP pre-increment. In GEN binary, JIP is at location src1 when immediate and at location src0 when in a register. The IP register must be put (for example, by the assembler) at dst location. When offsets are immediate, src0 must be null.</p> <p>Format: [(pred)] call (exec_size) dst JIP</p>			
Restriction			
The call instruction must have DWord source and destination type, and the destination must be QWord aligned.			
A call instruction must use a Switch			
A call instruction must be followed by an instruction that supports Switch. When call takes a jump, the first instruction must have a Switch.

Compare

cmp - Compare			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The <code>cmp</code> instruction performs component-wise comparison of <code>src0</code> and <code>src1</code> and stores the results in the selected flag register and in <code>dst</code>. It takes component-wise subtraction of <code>src0</code> and <code>src1</code>, evaluating the conditional code (excluding NS signal) based on the conditional modifier, and storing the conditional bits in bit-packed form in the destination flag register and all bits of <code>dst</code> channels. If the <code>dst</code> is not null, for the enabled channels, then all bits of the destination channel will contain the flag value for the channel. When the instruction operates on packed word format, one general register may store up to 16 such comparison results. In DWord format, one general register may store up to 8 results. A conditional modifier must be specified; the conditional modifier field cannot be 0000b. The comparison does not use the NS (NaN source) signals, as described in the Creating Conditional Flags section. Accordingly the conditional modifier should not be <code>.u</code> (unordered). For each enabled channel 0b or 1b is assigned to the appropriate flag bit and 0/all zeros or all ones (e.g, byte 0xFF, word 0xFFFF, DWord 0xFFFFFFFF) is assigned to <code>dst</code>. When any source type is floating-point, the <code>cmp</code> instruction obeys the rules described in the tables in the Floating Point Modes section of the Data Types chapter.</p>			
Format: <code>[(pred)] cmp[.cmo] (exec_size) dst src0 src1</code>			
Restriction			
Accumulator cannot be destination, implicit or explicit. The destination must be a general register or the null register.			
Syntax			
<code>[(pred)] cmp[.cmo] (exec_size) reg reg reg [(pred)] cmp[.cmo] (exec_size) reg reg imm32</code>			
Pseudocode			
<pre> Evaluate(WrEn); for (n = 0; n < exec_size; n++) { bitMask[n] = 0; if (WrEn.chan[n]) { results[n] = src0.chan[n] - src1.chan[n]; bitMask[n] = Condition(results[n]); dst.chan[n] = bitMask[n]; // All bits for dst channel } } flag# = bitMask; </pre>

Compare NaN

cmpn - Compare NaN			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The cmpn instruction performs component-wise special-NaN comparison of src0 and src1 and stores the results in the selected flag register and in dst. It takes component-wise subtraction of src0 and src1, evaluating the conditional signals including NS based on the conditional modifier, and storing the conditional flag bits in bit-packed form in the destination flag register and all bits of dst channels. If the dst is not null, for the enabled channels, then all bits of the destination channel will contain the flag value for the channel. When the instruction operates on packed word format, one general register may store up to 16 such comparison results. In DWord format, one general register may store up to 8 results. A conditional modifier must be specified; the conditional modifier field cannot be 0000b. More information about the conditional signals used is in the Creating Conditional Flags section. For each enabled channel 0b or 1b is assigned to the appropriate flag bit and 0/all zeros or all ones (e.g, byte 0xFF, word 0xFFFF, DWord 0xFFFFFFFF) is assigned to dst. Min/Max instructions use cmpn to select the destination from the input sources (see the Min Max of Floating Point Numbers section for details).</p>			
Format: [(pred)] cmpn[.cmod] (exec_size) dst src0 src1			
Restriction			
Accumulator cannot be destination, implicit or explicit. The destination must be a general register or the null register.			
.l and .ge are the only two conditional modifiers are supported for this instruction.			
Syntax			
[(pred)] cmpn[.cmod] (exec_size) reg reg reg [(pred)] cmpn[.cmod] (exec_size) reg reg imm32			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { bitMask[n] = 0; if (WrEn.chan[n]) { results[n] = src0.chan[n] - src1.chan[n]; bitMask[n] = ConditionNaN(results[n]); dst.chan[n][0] = bitMask[n]; // All bits for dst channel } } flag# = bitMask;</pre>

Conditional Select

csel - Conditional Select			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The csel instruction selectively moves components in src0 or src1 to the dst based on the result of the compare of src2 with zero. If the channel condition is true, data in src0 is moved into dst. Otherwise, data in src1 is moved into dst. The csel instruction provides the function of a cmp followed by sel. The instruction must not be used if cmpn is required. The instruction does not update the flag register. The comparison follows the same rule as cmp instruction for that data type.</p>			
Format: csel (exec_size) dst src0 src1 src2			
Syntax			
csel[.cmod] (exec_size) reg reg reg			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { bitMask[n] = 0; if (EMask.chan[n]) { result[n] = src2.chan[n] - 0; bitMask[n] = Condition(result[n]); if (bitMask[n] = 1) { dst.chan[n] = src0.chan[n]; } else { dst.chan[n] = src1.chan[n]; } } }</pre>

Conditional Send Message

sendc - Conditional Send Message			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The sendc instruction has the same behavior as the send instruction except the following. sendc first checks the dependent threads inside the Thread Dependency Register. There are up to 8 dependent threads in the TDR register. The sendc instruction executes only when all the dependent threads in the TDR register are retired. Wait for dependencies in the TDR Register to clear, then send a message stored in registers starting at src to a shared function identified by exdesc along with control from desc with a general register writeback location at dst.</p>			
Format: [(pred)] sendc (exec_size) dst src0 exdesc desc			
Restriction			
The sendc instruction has the same restrictions as the send instruction.			
Pseudocode			
if (TDR[7] ... TDR[2] TDR[1] TDR[0]) { wait; } Evaluate(WrEn); MsgChEnable = WrEn; SourceReg = src0.RegNum; MessageEnqueue(MsgChEnable, ResponseReg, SourceReg, desc, exdesc);

Continue

cont - Continue			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The cont instruction disables execution for the subset of channels for the remainder of the current loop iteration. Channels remain disabled until right before the while instruction or right before the condition check code block for the while instruction. If all enabled channels hit this instruction, jump to the instruction referenced by JIP where execution continues. UIP should always reference the loop's associated while instruction. JIP should point to the last instruction of the inner most conditional block if the cont instruction is inside a conditional block. In case of the break instruction directly under the loop, the JIP and the UIP are the same. If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.</p> <p>The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate.</p> <p>Format: [(pred)] cont (exec_size) JIP UIP</p>			
Restriction			
The execution size must be the same for the while, break, and cont instructions of the same code block.			
Syntax	Project		
[(pred)] cont (exec_size) imm32 imm32	BDW		
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.channel[n]) { if (PMask[n]) { // PMask is for all channels enabled for the cont instruction. PcIP[n] = IP + UIP; } else { PcIP[n] = IP + 1; } } } for (n = exec_size; n < 32; n++) { PcIP[n] = IP + 1; } if (PcIP != (IP + 1)) { // all channels true Jump(IP + JIP); }</pre>

Else

else - Else			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The else instruction is an optional statement within an if/else/endif block of code. It restricts execution within the else/endif portion to the opposite set of channels enabled under the if/else portion. Channels which were inactive prior to entering the if/endif block remain inactive throughout the entire block. All enabled channels upon arriving the else instruction will be redirected to the matching endif. If all channels are redirected (by else or before else), a relative jump is performed to the location specified by <JIP>. The jump target should be the matching endif instruction for that conditional block. The following table describes the 32-bit <JIP>. In GEN binary, <JIP> is at location <src1> and must be of type D (signed dword integer). <JIP> must be an immediate operand, it is a signed 32-bit number and is intended to be forward referencing. This value is added to IP pre-increment. If the < branch_ctrl > bit is set, then the <JIP> points to the first join instruction within the else block and <UIP> points to the endif instruction. If the <branch_ctrl> bit is not set, <JIP> and <UIP>, both point to endif.</p>			
Format: else (<exec_size>) <JIP> <UIP> <branch_ctrlt>			
Restriction			
Predication is not allowed.			
The execution size must be the same for the if, else, and endif instructions of the same code block.			
Syntax			
else (<exec_size>) imm32 imm32 <branch_ctrlt>			
Pseudocode			
<pre> Evaluate(WrEn); for (n = 0; n < 32; n++) { if (WrEn.channel[n] == 1 <branch_ctrlt>) { PcIP[n] = IP + <JIP>; } else { PcIP[n] = IP + <UIP>; } } if (PcIP != (IP+1)) { // for all channels Jump(IP + <JIP>;) } </pre>			
Errata	Description		
	If all channels are redirected (by else or before else), relative jump is performed to the location specified by <JIP> + 1.		
Predication	Conditional Modifier	Saturation	Source Modifier
N	N	N	N

Extended Math Function

math - Extended Math Function	
Project:	BDW
Source:	EuIsa
Length Bias:	4
<p>The math instruction performs extended math function on the components in src0, or src0 and src1, and write the output to the channels of dst. The type of extended math function are based on the FC[3:0] encoding in the table below.</p>	
<p>Format: <code>[(pred)] math (exec_size) dst src0 src1 <FC></code></p>	
Restriction	
Accumulator access is allowed only for ieee macro functions.	
The math instruction does not support indirect addressing modes.	
The only supported rounding mode for math instruction is Round to Nearest Even.	
INT DIV function does not support SIMD16.	
INT DIV function does not support simultaneous write to two registers.	
INT DIV function does not support source modifiers.	
The FDIV function is not supported in ALT_MODE.	
The math instruction can use GRF or immediates as source. The source formats for immediates must be one of the source formats supported by math operation.	
DepCtrl must not be used.	
The math instruction must use GRF as destination.	
The supported regioning mode for math instruction is align1 and align16. The following restrictions apply for align1 mode: Scalar source is supported. Source and destination horizontal stride must be the same. Regioning must ensure $Src.Vstride = Src.Width * Src.Hstride$. Source and destination offset must be the same, except the case of scalar source.	
For one source math operations src1 must be NULL.	
Syntax	
<code>[(pred)] math (exec_size) reg reg reg imm4</code>	
Pseudocode	
<pre> Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.channel[n] == 1) { switch FC[3:0] { case 1h: dst.channel[n] = rcp(src0.channel[n]); case 2h: dst.channel[n] = log(src0.channel[n]); case 3h: dst.channel[n] = exp(src0.channel[n]); case 4h: dst.channel[n] = sqrt(src0.channel[n]); case 5h: dst.channel[n] = rsq(src0.channel[n]); case 6h: </pre>	

math - Extended Math Function

```

    dst.channel[n] = sin(src0.channel[n]);
case 7h:
    dst.channel[n] = cos(src0.channel[n]);

Find First Bit from LSB Side

fbl - Find First Bit from LSB Side			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
The fbl instruction counts component-wise the number of LSB 0 bits before the first 1 bit in src0, storing that number in dst.			
Format: [(pred)] fbl (exec_size) dst src0			
Programming Notes			
If src0 contains no 1 bits, store 0xFFFFFFFF in dst.			
Restriction			
No accumulator access, implicit or explicit.			
Syntax			
[(pred)] fbl (exec_size) reg reg [(pred)] fbl (exec_size) reg imm32			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { UD cnt = 0; UD udScalar = src0.chan[n]; while ((udScalar & 1) == 0 && cnt != 32) { cnt ++; udScalar = udScalar » 1; } if (src0.chan[n] == 0x00000000) { dst.chan[n] = 0xFFFFFFFF; } else { dst.chan[n] = cnt; } } }</pre>

Fraction

frc - Fraction			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The frc instruction computes, component-wise, the truncate-to-minus-infinity fractional values of src0 and stores the results in dst. The results, in the range of [0.0, 1.0], are the fractional portion of the source data. The result is in the range [0.0, 1.0] irrespective of the rounding mode. Floating-point fraction computation follows the rules in the following tables, based on the current floating-point mode.</p>			
Format: [(pred)] frc[.cmod] (exec_size) dst src0			
Workaround			
<p>When the Rounding Mode in cr0.0 is not Round Down, the result from frc must be followed by compare and select instructions to avoid a result of 1.0. Those latter instructions must use the :ud type. For example: cmp.ne.f0.0 null r4:ud 0x3f800000:ud (f0.0)sel r5:f r4:ud 0x3f7ffff:ud</p>			
Syntax			
[(pred)] frc[.cmod] (exec_size) reg reg [(pred)] frc[.cmod] (exec_size) reg imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] - floor(src0.chan[n]); } }

Goto

goto - Goto	
Project:	BDW
Source:	EuIsa
Length Bias:	4
<p>The goto instruction directs the instruction pointer to the offset specified by the UIP offset or to the next IP based on the BranchCtrl bit in the instruction. The active channels that are predicated on this instruction will take the IP + UIP path when BranchCtrl is set else the channels take IP + 1. The active channels that are not predicated on this instruction will be made inactive and waiting to be joined at the join IP. The join IP is IP + UIP when BranchCtrl is clear else it is the next IP.</p> <p>When there are no active channels the instruction pointer will move to IP + JIP.</p> <p>The goto instruction is used in conjunction with a join instruction. A goto deactivates some channels that are reactivated at some program-specified join instruction. See the join instruction for the activation rules.</p> <p>The goto and join instructions enable unstructured program control flow. These instructions must be used with additional care where dangling channels can result without proper compiler checks, meaning that it is expected that programs will navigate through these paths to reactivate the channels. Hardware does not provide native checks or reconvergence.</p> <p>The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer).</p> <p>If SPF is ON, none of the PcIP are updated.</p>	
Format: [(pred)] goto (exec_size) JIP UIP BranchCtrl	
Restriction	
Cannot have a goto in the body and the corresponding join in the function or the subroutine. Similarly the brd and brc.	
Syntax	
[(pred)] goto (exec_size) imm32 imm32 BranchCtrl	
Pseudocode	
Evaluate(WrEn);	

goto - Goto

```

for ( n = 0; n < exec_size; n++ ) {
    if ( WrEn.chan[n] ) { // for the predicated active channels
        if ( BranchCtrl ) {
            PcIP[n] = IP + UIP; }
        else {
            PcIP[n] = IP + 1; }
    }
    else { // join IP, for the active non predicated channels
        if ( BranchCtrl ) {
            PcIP[n] = IP + 1; }
        else {
            PcIP[n] = IP + UIP; }
    }
}
if ( BranchCtrl ) { //
    if (PcIP != (IP + UIP) ) { // for all channels
        if (PcIP != (IP + 1) ) { // for all channels
            Jump(IP + JIP); }
        else {
            Jump(IP + 1); }
    }
    else {
        Jump(IP + UIP); }
}
else { //
    if (PcIP != (IP + 1) ) { // for all channels
        Jump(IP + JIP); }
    else {
        Jump(IP + 1); }
}
}
    
```

A goto instruction must not be followed by any instruction requiring register indirect access on source operands.

GPGPU_CSR_BASE_ADDRESS

GPGPU_CSR_BASE_ADDRESS						
Project:	BDW					
Source:	PRM					
Length Bias:	2					
The GPGPU_CSR_BASE_ADDRESS command sets the base pointers for EU and L3 to Context Save and Restore EU State and SLM for GPGPU mid.						
Programming Notes						
Execution of this command causes a full pipeline flush, thus its use should be minimized for higher performance. State and instruction caches are flushed on completion of the flush.						
SW must always program PIPE_CONTROL with "CS Stall" and "Render Target Cache Flush Enable" set prior to programming GPGPU_CSR_BASE_ADDRESS command for GPGPU workloads i.e when pipeline select is GPGPU via PIPELINE_SELECT command. This is required to achieve better GPGPU preemption latencies for certain programming sequences. If programming PIPE_CONTROL has performance implications then preemption latencies can be trade off against performance by not implementing this programming note.

Halt

halt - Halt			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The halt instruction temporarily suspends execution for all enabled compute channels. Upon execution, the enabled channels are sent to the instruction at (IP + UIP), if all channels are enabled at HALT, jump to the instruction at (IP + JIP). If the halt instruction is not inside any conditional code block, the values of JIP and UIP should be the same. If the halt instruction is inside a conditional code block, the UIP should be the end of the program and the JIP should be the end of the inner most conditional code block. The UIP must point to a HALT Instruction. If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.</p> <p>The following table describes the two 32-bit instruction pointer offsets. Both the JIP and UIP are signed 32-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at locations src0 and src1 and must be of type DW (signed DWord integer). When the offsets are immediate, src0 regfile must be immediate.</p> <p>Format: [(pred)] halt (exec_size) JIP UIP</p>

	Project:		BDW
	Format:		MBZ
Ignored			
12	Last Render Target Select		
	Project:		All
	Format:		Enable
<p>This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. In general, when threads are not launched by 3D FF, this bit must be zero.</p>			
Programming Notes			
<p>When a pixel shader has render target writes at finer granularity than the dispatch rate, last render target write to a null surface must be present at the dispatch rate with this bit set. In particular, if a kernel is dispatched at pixel rate and it only writes to render targets at sample-rate, it must include a pixel-rate render target write to a null surface with Last Render Target Select bit enabled.</p>			
11	Slot Group Select		
	Project:		All
	Format:		MDC_RT_SGS
This field selects whether slots 15:0 or slots 31:16 are used for bypassed data.			
10:8	Render Target Message Subtype

Specifies the Binding Table Index for the message			

If

if - If							
Project:	BDW						
Source:	EuIsa						
Length Bias:	4						
Description							
<p>An if instruction starts an if/endif or an if/else/endif block of code. It restricts execution within the conditional block to only those channels that were enabled via the predicate control. Each if instruction must have a matching endif instruction and may have up to one matching else instruction before the matching endif. If all channels are inactive (for the if/endif or if/else/endif block), a jump is performed to the instruction referenced by JIP. This jump must be to right after the matching else instruction when present, or otherwise to the matching endif instruction of the conditional block. If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.</p> <p>The following table describes the 32-bit exit code <JIP> and <UIP>. If <branch_ctrl> is set, then the JIP points to the first join instruction within the if block. If <branch_ctrl> is not set, <JIP> should point to the instruction right after the matching else instruction if it exists, otherwise <JIP> should point to the endif instruction. <UIP> should always point to the endif instruction. When a jump occurs, this value is added to IP pre-increment. In GEN instruction binary, <JIP> and <UIP> are at location <src0> & <src1> and must be of type D (signed dword integer).</p> <p>Format: [(pred)] if (exec_size JIP UIP <branch_ctrl></p>							
Restriction							
The execution size must be the same for the if, else, and endif instructions of the same code block.							
Syntax	Project						
[(pred)] if (exec_size) imm32 imm32 <branch_ctrl>	BDW						
Pseudocode							
<pre>Evaluate(WrEn); for (n = 0; n < 32; n++) { if (WrEn.channel[n] == 0) { PcIP[n] = IP + JIP; } else { PcIP[n] = IP + 1; } } if (PcIP != (IP + 1)) { // for all channels Jump(IP + JIP); }</pre>

Illegal

illegal - Illegal			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The Illegal Opcode Exception Enable flag in cr0.1 is normally set so the normal processing of an illegal opcode is to transfer control to the System Routine. Instruction dispatch treats any unused 8-bit opcode (including bit 7 of the instruction, reserved for future opcode expansion) as if it is the illegal opcode. The illegal opcode is zero because that byte value is more likely than most to be read via a wayward instruction pointer. The illegal instruction is an instruction only in the same way that a NULL pointer in software is a pointer. Both are special values indicating invalid instances.</p>			
Format: illegal			
Restriction			
The illegal instruction takes no instruction options.			
Syntax			
illegal			
Pseudocode			
{ Set the Illegal Opcode Exception Status bit in cr0.1. if (Illegal Opcode Exception Enable is set in cr0.1) { Transfer control to the System Routine (return address to AIP, IP = SIP). } }

Integer Subtraction with Borrow

subb - Integer Subtraction with Borrow			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The subb instruction performs component-wise subtraction of src0 and src1 and stores the results in dst, it also stores the borrow into acc. If the operation produces a borrow (src0 < src1), write 0x00000001 to acc, else write 0x00000000 to acc.</p>			
<p>Format: [(pred)] subb[.cmod] (exec_size) dst src0 src1</p>			
Restriction			
<p>AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.</p>			
Syntax			
<p>[(pred)] subb[.cmod] (exec_size) reg reg reg [(pred)] subb[.cmod] (exec_size) reg reg imm32</p>			
Pseudocode			
<p>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] - src1.chan[n]; acc.chan[n] = borrow(src.chan[n] - src1.chan[n]); } }</p>

Join

join - Join			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The join instruction makes the inactive channels active at the join IP if those channels are predicated. Any deactivated channels due to a goto instruction match the join IP are activated (qualified with predicates at join). If no IP is matched at this join, the program goes to the next IP with the active channels which followed the program path up to the join instruction. If no active channels are present after executing the join instruction, the program jumps to the offset specified by JIP instead of next IP. The join instruction is used in conjunction with a goto instruction. The join activates channels that are deactivated by the goto instruction. See the goto instruction for the deactivation rules. The goto and join instructions enable unstructured program control flow. These instructions must be used with additional care where dangling channels can result without proper compiler checks, meaning that it is expected that programs will navigate through these paths to reactivate the channels. Hardware does not provide native checks or reconvergence. The following table describes the 32-bit JIP. In GEN binary, JIP is at location src1 and must be of type D (signed DWord integer). JIP must be an immediate operand and is a signed 32-bit number. This value is added to IP pre-increment. If SPF is ON, none of the PcIP are updated.</p>			
Format: [(pred)] join (exec_size) JIP			
Programming Notes			
An index of 0 does nothing, continuing execution with the next instruction.			
An index of -16 (if the jmp instruction is in native format) or -8 (if the jmp instruction is in compact format) is an infinite loop on the jmp instruction.			
Restriction			
The {NoMask} instruction option must be specified.			
The index data type must be D (Signed DWord Integer).			
Syntax			
[(pred)] join (exec_size) imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { // for the predicated channels and the remaining channels PcIP[n] = IP + 1; } } if (PcIP != (IP + 1)) { // for all channels when no channels are activated and no other active channels Jump(IP + JIP); }

Jump Indexed

jmp_i - Jump Indexed			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The jmp_i instruction redirects program execution to an index offset relative to the post-incremented instruction pointer. The index is a signed integer value, with positive or zero integers for forward jumps, and negative integers for backward jumps. Note: Unlike other flow control instructions, the offset used by jmp_i is relative to the incremented instruction pointer rather than the IP value for the instruction itself. In GEN binary, index is at location src1. The ip register must be put (for example, by the assembler) at the dst and src0 locations. Predication is allowed to provide conditional jump with a scalar condition. As the execution size is 1, the first channel of PMASK (flags post prediction control and negate) is used to determine whether the jump is taken or not. If the condition is false, the jump is not taken and execution continues with the next instruction.</p>			
Format: [(pred)] jmp_i (1) index {NoMask}			
Programming Notes			
An index of 0 does nothing, continuing execution with the next instruction.			
An index of -16 (if the jmp_i instruction is in native format) or -8 (if the jmp_i instruction is in compact format) is an infinite loop on the jmp_i instruction.			
Restriction			
The execution size must be 1.			
The {NoMask} instruction option must be specified.			
The index data type must be D (Signed DWord Integer).			
QtrCtrl must not be used for jmp_i instruction.			
Syntax			
[(pred)] jmp_i (1) reg32 {NoMask} [(pred)] jmp_i (1) imm32 {NoMask}			
Pseudocode			
Evaluate(WrEn); if (WrEn != 0) { Jump(IP + 1 + index); // IP + 1 is a pseudocode idiom for the IP of the following instruction. }

Linear Interpolation

Irp - Linear Interpolation			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
The Irp instruction takes component-wise multiplication of src0 and src1, and adds the result to the component-wise multiplication of src2 and (1 - src0), and then stores the final results in dst.			
Format: [(pred)] Irp[.cmod] (exec_size) dst src0 src1 src2			
Restriction			
The vertical stride (VertStride) is overloaded to 4 in HW for 3-source instructions.			
The overflow conditional modifier (.o) is not allowed.			
No explicit accumulator access because this is a three-source instruction. AccWrEn is allowed for implicitly updating the accumulator.			
All three-source instructions have certain restrictions, described in Instruction Formats [BDW].			
Syntax			
[(pred)] Irp[.cmod] (exec_size) reg reg reg			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src1.chan[n] * src0.chan[n] + src2.chan[n] * (1.0 - src0.chan[n]); } }

Logic And

and - Logic And			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The and instruction performs component-wise logic AND operation between src0 and src1 and stores the results in dst. Register source operands can use source modifiers: Any source modifier is logical, optionally changing a source value <i>s</i> to <i>~s</i> (inverting all source bits). This capability allows expressions like a AND (NOT b) to be calculated with one instruction. This operation does not produce sign or overflow conditions. Only the .e/.z or .ne/.nz conditional modifiers should be used.</p>			
Format: Source modifier is not allowed if source is an accumulator.			
Restriction			
Source modifier is not allowed if source is an accumulator.			
Syntax			
[[pred]] and[.cmod] (exec_size) reg reg reg [[pred]] and[.cmod] (exec_size) reg reg imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] & src1.chan[n]; } }

MEDIA_OBJECT_GRPID

MEDIA_OBJECT_GRPID			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
<p>The MEDIA_OBJECT_GRPID command is a variation of MEDIA_OBJECT which includes a group id which is used to allocate and track Barriers and Shared Local Memory. The Interface Descriptor is used to specify how much SLM is needed and how many threads will be reporting to the Barrier. All MEDIA_OBJECT_GRPIDs with the same group id should have the same interface descriptor and be dispatched to the same Tslice – the dispatcher will ensure this if Force Destination = 0, but software must ensure this if Force Destination = 1. Software should also ensure that all the threads needed for the Barrier will fit into a Tslice, or the Barrier will never be satisfied. Either SLM or a barrier must be used with MEDIA_OBJECT_GRPID, if neither is needed then a MEDIA_OBJECT must be used instead.</p> <p>MEDIA_OBJECT_GRPID supports the GPGPU version of payload delivery – either indirect or CURBE can be split between the threads in a group (per-thread payload), as well as a section which is sent to all threads (cross-thread payload). See the GPGPU payload section. For indirect, the same pointer must be sent with all the commands associated with the thread group for payload splitting to work properly. Inline data is not split, but the payload attached to each command is sent with that thread. Only one of inline, indirect, or CURBE is allowed, but at least one form of payload must be sent.</p> <p>MEDIA_STATE_FLUSH with the watermark bit must be placed between groups created by MEDIA_OBJECT_GRPID. The Interface Descriptor associated with the watermark must match the Interface Descriptor used for the following group.</p>

MEDIA_OBJECT_PRT

MEDIA_OBJECT_PRT						
Project:	BDW					
Source:	RenderCS					
Length Bias:	2					
<p>command is for generating Persistent Root Thread for the media pipeline. It only supports loading of inline data but not indirect data. This command should be used for a root thread that might have to be present in the system for a period longer than the certain minimal context-switch interrupt latency. It has to honor the context interrupt signal to terminate upon request. It should also handle replay from the interrupted point upon context restore (the same thread being dispatched more than once). In contrary, if a thread is not a Persistent Root Thread, if dispatched, it must run to completion. The command can be used in all VFE modes, except VLD mode.</p> <p>For simplification, _PRT command has a fixed size of 16 DWORD</p>

Length Bias:	2		
<p>This command updates the Message Gateway state. In particular, it updates the state for a selected Interface Descriptor. This command can be considered same as a MI_Flush except that only media parser will get flushed instead of the entire 3D/media render pipeline. The command should be programmed prior to new Media state, curbe and/or interface descriptor commands when switching to a new context or programming new state for the same context. With this command, pipelined state change is allowed for the media pipe. It should be cautious when using this command when child_present flag in the media state is enabled. This is because that CURBE state as well as Interface Descriptor state are shared between root threads and child threads. Changing these states while child threads are generated on the fly may cause unexpected behavior. Combining with MI_ARB_ON/OFF command, it is possible to support interruptability with the following command sequence where interrupt may be allowed only when MI_ARB_ON_OFF is ON: MEDIA_STATE_FLUSH VFE_STATE // VFE will hold CS if watermark isn't met MI_ARB_OFF // There must be at least one VFE command before this one MEDIA_OBJECT MI_ARB_ON</p>

Format:	Enable						
6	<p>Watermark Required</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 60%;">Project:</td> <td>All</td> </tr> </table> <p>This is a single bit specifying if the MEDIA_STATE_FLUSH should stall further commands until there is enough room in a half-slice for the following thread group. The characteristics of the thread group are specified in the Interface Descriptor Offset. If set, the MEDIA_STATE_FLUSH stalls CS until there are enough threads in a half-slice, and enough SLM available in the same half-slice, and a free barrier if one is required. An Interface Descriptors can be updated after a Watermarked MEDIA_STATE_FLUSH only if it has not been used in the current context. Reusing an interface descriptor requires that this bit is clear to ensure the ID cache is reloaded. If clear, the MEDIA_STATE_FLUSH stalls CS until the TDL has dispatched the last thread, allowing the CURBE and Interface Descriptors to be updated by following commands.</p> <table border="1" style="width: 100%; background-color: #e6f2ff;"> <tr> <th colspan="2" style="text-align: center;">Programming Notes</th> </tr> <tr> <td colspan="2">The Interface Descriptor Offset used for the flush must be the same as that used for the GPGPU_OBJECTs. 		Format:	MBZ					

MEDIA_VFE_STATE		
7:4	Stack Size	
	Value	Name
	[0,11]	indicating [1KBytes, 2MBytes]
Programming Notes		
Since the stack uses the upper portion of the scratch space, Stack Size = < Per Thread Scratch Space		
3:0	Per Thread Scratch Space	
	Format:	U4
Specifies the amount of scratch space allowed to be used by each thread. The driver must allocate enough contiguous scratch space, pointed to by the Scratch Space Pointer, to ensure that the maximum threads in the device each get Per Thread Scratch Space size without exceeding the driver-allocated scratch space.		
	Value	Name
	[0,11]	indicating [1k bytes, 2 Mbytes]: 0 -> 1k, 1->2k, 2->4k, 3->8k ... 11->2M
2	Reserved	
	Format:	MBZ
15:0	Scratch Space Base Pointer High	
	Format:	GeneralStateOffset[47:32]
This field specifies the high 16 bits of starting address of the Scratch Space Base Pointer		
3	Maximum Number of Threads	
	Format:	U16-1 representing thread count
Range: [0, n-1] where n = (# EUs) * (# threads/EU). See <i>Graphics Processing Engine</i> for listing of #EUs and #threads in each device.		
Specifies the maximum number of simultaneous root threads allowed to be active. Used to avoid potential deadlock. If child threads are not planning on being used then this field can be set to its maximum value and there will be no thread limit beyond what is currently available in the system; the maximum value can include threads in slices that have been shut down for power reasons.		
Programming Notes		
MSB will be zero due to the range limit below.		

MEDIA_VFE_STATE

MFC_AVC_PAK_OBJECT

MFC_AVC_PAK_OBJECT			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFC_AVC_PAK_OBJECT command is the second primitive command for the AVC Encoding Pipeline. The same command is used for both CABAC and CAVLC modes. The MV Data portion of the bitstream is loaded as indirect data object. Before issuing a MFC_AVC_PAK_OBJECT command, all AVC MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command. MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice. MFC_AVC_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.</p>

MFC_MPEG2_PAK_OBJECT

MFC_MPEG2_PAK_OBJECT			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFC_MPEG2_PAK_OBJECT command is the second primitive command for the MPEG-2 Encoding Pipeline. Different from AVC, the MV Data portion of the bitstream is loaded as part of MB control data. Before issuing a MFC_MPEG2_PAK_OBJECT command, all MPEG2_MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command. MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice.</p> <p>MFC_ MPEG2_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.</p>

MFC_MPEG2_SLICEGROUP_STATE

3:0

CV0 - Clamp Value 0 (Encoder-only)

If the magnitude of coefficients at locations assigned with CV0 (mapping shown below) exceeds 2CV0-1, they are replaced with 2CV0-1. For coefficients at locations marked as 'none', no clamping is performed. The following mappings are only applied to luma and chroma blocks\subblocks containing AC coefficients (blocks\subblocks with only DC coeffs will not be clamped).

For 8x8 frame block, each coefficient is mapped to one of the eight CV values as following:

none	none	CV7	CV6	CV5	CV4	CV3	CV3
none	CV7	CV6	CV5	CV4	CV3	CV3	CV2
CV7	CV6	CV5	CV4	CV3	CV3	CV2	CV2
CV6	CV5	CV4	CV3	CV3	CV2	CV2	CV1
CV5	CV4	CV3	CV3	CV2	CV2	CV1	CV1
CV4	CV3	CV3	CV2	CV2	CV1	CV1	CV0
CV3	CV3	CV2	CV2	CV1	CV1	CV0	CV0
CV3	CV2	CV2	CV1	CV1	CV0	CV0	CV0

For 8x8 field block, each coefficient is mapped to one of the eight CV values as following:

none	none	CV6	CV5	CV4	CV3	CV2	CV1
none	CV7	CV6	CV5	CV4	CV3	CV2	CV1
CV7	CV6	CV5	CV4	CV3	CV3	CV2	CV1
CV7	CV6	CV5	CV4	CV3	CV2	CV2	CV1
CV6	CV5	CV4	CV4	CV3	CV2	CV1	CV0

MFD_AVC_BSD_OBJECT

MFD_AVC_BSD_OBJECT			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
Description			
<p>The MFD_AVC_BSD_OBJECT command is the only primitive command for the AVC Decoding Pipeline. The same command is used for both CABAC and CAVLD modes. The Slice Data portion of the bitstream is loaded as indirect data object. Before issuing a MFD_AVC_BSD_OBJECT command, all AVC states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_AVC_BSD_OBJECT command.</p>			
Context switch interrupt is not supported by this command.

MFD_AVC_SLICEADDR

MFD_AVC_SLICEADDR			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a Slice level command used only for DXVA2 AVC Short Slice Bitstream Format VLD mode. When decoding a slice, H/W needs to know the last MB of the slice has reached in order to start decoding the next slice. It also needs to know if a slice is terminated but the last MB has not reached, error concealment should be invoked to generate those missing MBs. For AVC DXVA2 Short Format, the only way to know the last MB position of the current slice, H/W needs to snoop into the next slice's start MB address (a linear address encoded in the Slice Header). Since each BSD Object command can have only one indirect bitstream buffer address, this command is added to help H/W to snoop into the next slice's slice header and retrieve its Start MB Address. This command will take the next slice's bitstream buffer address as input (exactly the same way as a BSD Object command), and parse only the first_mb_in_slice syntax element. The result will be stored inside the H/W, and will be used to decode the current slice specified in the BSD Object command. Only the very first few bytes (max 5 bytes for a max 4K picture) of the Slice Header will be decoded, the rest of the bitstream are don't care. This is because the first_mb_in_slice is encoded in Exponential Golomb, and will take 33 bits to represent the max 256 x 256 = 64K-1 value. The indirect data of MFD_AVC_SLICEADDR is a valid BSD object and is decoded as in BSD OBJECT command. The next Slice Start MB Address is also exposed to the MMIO interface. The Slice Start MB Address (first_mb_in_slice) is a linear MB address count; but it is translated into the corresponding 2D MB X and Y raster position, and are stored internally as NextSliceMbY and NextSliceMbX.</p>

MFD_MPEG2_BSD_OBJECT

MFD_MPEG2_BSD_OBJECT			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>Different from AVC and VC1, MFD_MPEG2_BSD_OBJECT command is pipelinable. This is for performance purpose as in MPEG2 a slice is defined as a group of MBs of any size that must be within a macroblock row. Slice header parameters are passed in as inline data and the bitstream data for the slice is passed in as indirect data. Of the inline data, slice_horizontal_position and slice_vertical_position determines the location within the destination picture of the first macroblock in the slice. The content in this command is identical to that in the MEDIA_OBJECT command in VLD mode described in the Media Chapter.</p>

28:0	Indirect Data Start Address This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the BSD Indirect Object Base Address. Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the MPEG2 VLD bitstream data This address points to the first byte of the MB layer data, i.e. not including slice header.											
3..4	31:0	Inline Data All the required Slice Header parameters and error handling settings are captured as MPEG2_BSD_OBJECT Inline Data Descriptor structures. It has a fixed size of 2 DWs. Its definition is described in the next section.										

MFD_VC1_BSD_OBJECT

MFD_VC1_BSD_OBJECT

Project: BDW
 Source: VideoCS
 Length Bias: 2

The MFD_VC1_BSD_OBJECT command is the only primitive command for the VC1 Decoding Pipeline. The macroblock data portion of the bitstream is loaded as indirect data object. Before issuing a MFD_VC1_BSD_OBJECT command, all VC1 states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_VC1_BSD_OBJECT command. VC1 deblock filter kernel cross the slice boundary if in the last MB row of a slice, so need to know the last MB row of a slice to disable the edge mask. There is why VC1 BSD hardware need to know the end of MB address for the current slice. As such no more phantom slice is needed for VC1, as long as the driver will program both start MB address in the current slice and the start MB address of the next slice. As a result, we can also support multiple picture state commands in between slices.

MFD_VC1_LONG_PIC_STATE

MFD_VC1_LONG_PIC_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>MFX_VC1_LONG_PIC_STATE command encapsulates the decoding parameters that are read or derived from bitstream syntax elements above (inclusive) picture header layer. These parameters are static for a picture and when slice structure is present, these parameters are not changed from slice to slice of the same picture. Hence, this command is only issued at the beginning of processing a new picture and prior to the VC1_*_OBJECT command. The values set for these state variables are retained internally across slices. Only the parameters needed by hardware (BSD unit) to decode bit sequence for the macroblocks in a picture layer or a slice layer are presented in this command. Other parameters such as the ones used for inverse transform or motion compensation are provided in MFX_VC1_PRED_PIPE_STATE command. This Long interface format is intel proprietary interface. Driver will need to perform addition operations to generate all the fields in this command.</p>

If there is an I-picture before a B (in decoding order) then this field is not set (as a result, zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture). When the current picture being decoded is an I, P or BI, this bit is set to 0, since there is no DMV read in these picture decoding process. This field is not used in IT mode, used in VLD mode only.</p>	Project:	BDW

Programming Notes												
This bit field is taken from bRcontrol in DXVA_PictureParameters data structure												

MFD_VC1_LONG_PIC_STATE

12	SyncMarker			
		Project:	BDW	
		Indicates whether sync markers are enabled/disabled. If enable, sync markers "may be" present in the current video sequence being decoded. It is a sequence level syntax element and is valid only for Simple and Main Profiles.		
		Value	Name	Description
		0h	Not Present	Sync Marker is not present in the bitstream
		1h	Maybe present	Sync Marker maybe present in the bitstream
		Programming Notes		
		This field is only valid in VLD mode. For Simple Profile, SyncMarker must set to 0. For Main Profile, SyncMarker can be set to 0 or 1. This field is used in both intel and MS DXVA2 VLD interface, but not used in IT mode.		
11:8	Motion Vector Mode			
		Project:	BDW	
		This field indicates one of the following motion compensation interpolation modes for P and B pictures. The MC interpolation modes apply to prediction values of luminance blocks and are always in quarter-sample. For chrominance blocks, it always performs bilinear interpolation with either half-pel or quarter-pel precision. Before the polarity of Chroma Half-pel or Q-pel is reversed from DXVA2 Spec, now I have fixed it to match with DXVA2 VC1 Spec.		
		Value	Name	Description
		0XX0b		Chroma Quarter -pel + Luma bicubic. (can only be 1MV)
		0XX1b		Chroma Half-pel + Luma bicubic. (can be 1MV or 4MV)
		1XX0b		Chroma Quarter -pel + Luma bilinear. (can only be 1MV)
		1XX1b		Chroma Half-pel + Luma bilinear
		Programming Notes		
		Bits 11:8 are taken from bMVprecisionAndChromaRelation in DXVA_PictureParameters data structure. Bit 11 of Motion Vector Mode = 1 for Luma Bilinear MC; = 0 for Luma Bicubic MC. Bit 8 of Motion Vector Mode = 1 for half-sample Chroma motion = 0 for quarter-sample Chroma motion. This field is used in both VLD and IT modes.

MFD_VC1_LONG_PIC_STATE

5		LOOPFILTER Enable Flag	<p>This field is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit. When this bit is set to 1, PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command must also be set to 1. In this case, in-loop deblocking operation follows the VC1 standard - deblocking doesn't cross slice boundary. When this bit is set to 0, but PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary. This field is used in VLD mode only, not in IT mode.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 20%;">Name</th> <th style="width: 60%;">Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Disable</td> <td>Disables loop filter</td> </tr> <tr> <td>1h</td> <td>Enable</td> <td>Enables loop filter</td> </tr> </tbody> </table>	Value	Name	Description	0h	Disable	Disables loop filter	1h	Enable	Enables loop filter

Bitplane buffer is a linear buffer. It is needed only when the bitplane is not encoded as raw, and therefore is present in the header explicitly. In VC1 Long Format (Gen6 and Gen7), it is written by an application and later read by the HW. In VC1 Long Format (Gen6 and Gen7), it is written by an application, and later read by the HW. But in VC1 Short Format (Gen7 only), it is written and read by H/W only. This field is specified for better performance. For Gen6 : The pitch must be equal to PictureWidthInMBs/2. For Gen7 VC1 Long Format : The pitch must be equal to PictureWidthInMBs/2. For Gen7 VC1 Short Format : If Pic Width is less than or equal to 2K pixels, bitplane pitch is set to 64 (one cacheline; programmed as 63) bytes per MB row. If Pic Width is greater than 2K pixels, bitplane pitch is set to 128 (two cachelines; programmed as 127) bytes per MB row. This field is not used in IT mode, used in VLD mode only. For VC1 DXVA2 Short Format, the bitplane specification is between H/W and Driver only. For Long Format, application is responsible for allocation with the driver.</p>	Format:	U7-1 Pitch in Bytes						
	Format:	U7-1 Pitch in Bytes								
	23	<p>Interpolation Runder Control</p> <p>Used only in MC operation. This field specifies the rounding control value used in interpolation operation of motion prediction process. Note: This bit field is taken from bRcontrol in DXVA_PictureParameters data structure. This field is used in VLD and IT modes.</p>								
22:20	<p>Reserved</p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>MBZ</td> </tr> </table>	Project:	All	Format:	MBZ

19:16	<p>Motion Vector Mode</p> <p>This field indicates one of the following motion compensation interpolation modes for P and B pictures. The MC interpolation modes apply to prediction values of luminance blocks and are always in quarter-sample. For chrominance blocks, it always performs bilinear interpolation with either half-pel or quarter-pel precision. 0XX0 = Chroma Quarter -pel + Luma bicubic. (can only be 1MV) 0XX1 = Chroma Half-pel + Luma bicubic. (can be 1MV or 4MV) 1XX0 = Chroma Quarter -pel + Luma bilinear. (can only be 1MV) 1XX1 = Chroma Half-pel + Luma bilinear. Note: Bits 19:16 are taken from bMVprecisionAndChromaRelation in DXVA_PictureParameters data structure. Bit 19 of Motion Vector Mode = 1 for Luma Bilinear MC; = 0 for Luma Bicubic MC. Bit 16 of Motion Vector Mode = 1 for half-sample Chroma motion = 0 for quarter-sample Chroma motion. This field is used in both VLD and IT modes. Before the polarity of Chroma Half-pel or Q-pel is reversed from DXVA2 Spec, now I have fixed it to match with DXVA2 VC1 Spec.</p>											
15	<p>DmvSurfaceValid</p> <p>Indicated when the DMV read surface is valid. This surface stored the direct motion vectors. This field is set for B pictures that can refer to a previous P picture for DMV. If there is an I-picture before a B (in decoding order) then this field is not set (as a result, zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture). This field is not used in IT mode, used in VLD mode only.</p>

MFD_VC1_SHORT_PIC_STATE

This field specifies whether the reference picture pixel values should be scaled up or scaled down on-the-fly, if RangeReduction is Enabled. NOTE: This bit is derived by driver for Main Profile only. Ignored in Simple and Advanced Profiles. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture only. Driver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description
0h	Disable [Default]	Scale down reference picture by factor of 2
1h	Enable	Scale up reference picture by factor of 2

28 Range Reduction Enable

Project:	All
----------	-----

This field specifies whether on-the-fly pixel value range reduction should be performed for the preceding (or forward) reference picture. Along with RangeReductionScale to specify whether scale up or down should be performed. It is not the same value as RANGEREDFRM Syntax Element (DXVA_PictureParameters bPicDeblocked bit 5) in the Picture Header. This field is for Main Profile only. Simple Profile is always disable, and not applicable to Advanced Profile. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks » 3) & 1. RANGEREDFRM is the same as (bPicDeblocked » 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture only. Driver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description
0h	Disable [Default]	Range reduction is not performed
1h	Enable	Range reduction is performed

	Number of consecutive B Frames.							

MFD_VC1_SHORT_PIC_STATE				
	7	PANSCAN Present Flag		
		Value	Name	
		Description		
		0		Pan Scan Parameters are not present in the picture header
		1		Pan Scan Parameters are present in the picture header
	6	REFDIST_FLAG For header parsing REFDIST.This is used in DXVA2 VC1 VLD mode only, not used in IT and intel VC1 VLD modes.		
	5	LOOPFILTER Enable Flag This field is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit.When this bit is set to 1, PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command must also be set to 1. In this case, in-loop deblocking operation follows the VC1 standard - deblocking doesn't cross slice boundary.When this bit is set to 0, but PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary.This field is used in VLD mode only, not in IT mode.		
		Value	Name	Description
		0		In-Loop-Deblocking-Filter is disabled
		1		In-Loop-Deblocking-Filter is enabled
	4	FastUVMCFlag (Fast UV Motion Compensation Flag) This field specifies whether the motion vectors for UV is rounded to half or full pel position. It is identical to the variable FASTUVMC in VC1 standard.This field is used in both VLD and IT modes.It is derived from FASTUVMC = (bPicSpatialResid8 » 4) & 1 in both VLD and IT modes, and should have the same value as Motion Vector Mode LSBit.		
		Value	Name	Description
	0h		no rounding	
	1h		quarter-pel offsets to half/full pel positions	
3	EXTENDED_MV Present Flag BitFieldDesc			
	Value	Name	Description	
	0h		Extended_MV is not present in the picture header

MFX_AVC_DIRECTMODE_STATE

MFX_AVC_DIRECTMODE_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a picture level command and is issued once per picture. All DMV buffers are treated as standard media surfaces, in which the lower 6 bits are used for conveying surface states. Current Pic POC number is assumed to be available in POCList[32 and 33] of the MFX_AVC_DIRECTMODE_STATE Command. This command is only valid in the AVC decoding in VLD and IT modes, and AVC encoder mode. The same command supports both Long and Short DXVA2 AVC Interface. The DMV buffers are not required to be programmed for encoder mode.</p>

		<p>Programming Notes</p> <p>It is derived from <code>ImgDisposableFlag = (nal_ref_idc == 0)</code>. <code>nal_ref_idc</code> is a syntax element from a NAL unit. When this flag is set, no reference picture and DMV are written out. This field is only valid for VLD decoding mode.</p>										
5	ConstrainedIPredFlag	<p>Constrained Intra Prediction Flag, <code>constrained_ipred_flag</code> It is set to the value of the syntax element in the current active PPS.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Value</th> <th style="width: 15%;">Name</th> <th style="width: 75%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>INTRA_AND_INTER</td> <td>allows both intra and inter neighboring MB to be used in the intra-prediction encoding of the current MB.</td> </tr> <tr> <td style="text-align: center;">1</td> <td>INTRA_ONLY</td> <td>allows only to use neighboring Intra MBs in the intra-prediction encoding of the current MB. If the neighbor is an inter MB, it is considered as not available.</td> </tr> </tbody> </table>		Value	Name	Description	0	INTRA_AND_INTER	allows both intra and inter neighboring MB to be used in the intra-prediction encoding of the current MB.	1	INTRA_ONLY	allows only to use neighboring Intra MBs in the intra-prediction encoding of the current MB. If the neighbor is an inter MB, it is considered as not available.
Value	Name	Description										
0	INTRA_AND_INTER	allows both intra and inter neighboring MB to be used in the intra-prediction encoding of the current MB.										
1	INTRA_ONLY	allows only to use neighboring Intra MBs in the intra-prediction encoding of the current MB. If the neighbor is an inter MB, it is considered as not available.										
4	Direct8x8InffFlag	<p>Direct 8x8 Inference Flag, <code>direct_8x8_inference_flag</code> It is set to the value of the syntax element in the current active SPS. It specifies the derivation process for luma motion vectors in the Direct MV coding modes (<code>B_Skip</code>, <code>B_Direct_16x16</code> and <code>B_Direct_8x8</code>). When <code>frame_mbs_only_flag</code> is equal to 0, <code>direct_8x8_inference_flag</code> shall be equal to 1. It must be consistent with the <code>frame_mbs_only_flag</code> and <code>transform_8x8_mode_flag</code> settings.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Value</th> <th style="width: 15%;">Name</th> <th style="width: 75%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>SUBBLOCK</td> <td>allows subpartitioning to go below 8x8 block size (i.e. 4x4, 8x4 or 4x8)</td> </tr> <tr> <td style="text-align: center;">1</td> <td>BLOCK</td> <td>allows processing only at 8x8 block size. MB Info is stored for 8x8 block size.</td> </tr> </tbody> </table>		Value	Name	Description	0	SUBBLOCK	allows subpartitioning to go below 8x8 block size (i.e. 4x4, 8x4 or 4x8)	1	BLOCK	allows processing only at 8x8 block size. MB Info is stored for 8x8 block size.
Value	Name	Description										
0	SUBBLOCK	allows subpartitioning to go below 8x8 block size (i.e. 4x4, 8x4 or 4x8)										
1	BLOCK	allows processing only at 8x8 block size. MB Info is stored for 8x8 block size.										
3	Transform8x8Flag	<p>8x8 IDCT Transform Mode Flag, <code>trans8x8_mode_flag</code> Specifies 8x8 IDCT transform may be used in this picture It is set to the value of the syntax element in the current active PPS.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Value</th> <th style="width: 15%;">Name</th> <th style="width: 75%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>4x4</td> <td>no 8x8 IDCT Transform, only 4x4 IDCT transform blocks are present</td> </tr> <tr> <td style="text-align: center;">1</td> <td>8x8</td> <td>8x8 Transform is allowed</td> </tr> </tbody> </table>		Value	Name	Description	0	4x4	no 8x8 IDCT Transform, only 4x4 IDCT transform blocks are present	1	8x8	8x8 Transform is allowed
Value	Name	Description										
0	4x4	no 8x8 IDCT Transform, only 4x4 IDCT transform blocks are present										
1	8x8	8x8 Transform is allowed										

MFX_AVC_IMG_STATE													
	2	<p>FrameMbOnlyFlag Frame MB only flag, frame_mbs_only_flag. It is set to the value of the syntax element in the current active SPS.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>FALSE</td> <td>not true ; effectively enables the possibility of MBAFF mode.</td> </tr> <tr> <td>1</td> <td>TRUE</td> <td>true, only frame MBs can occur in this sequence, hence disallows the MBAFF mode and field picture.</td> </tr> </tbody> </table>	Value	Name	Description	0	FALSE	not true ; effectively enables the possibility of MBAFF mode.	1	TRUE	true, only frame MBs can occur in this sequence, hence disallows the MBAFF mode and field picture.		
	Value	Name	Description										
	0	FALSE	not true ; effectively enables the possibility of MBAFF mode.										
1	TRUE	true, only frame MBs can occur in this sequence, hence disallows the MBAFF mode and field picture.											
1	<p>MbaffFlameFlag MBAFF mode is active, mbaff_frame_flag. It is derived from MbaffFrameFlag = (mb_adaptive_frame_field_flag && ! field_pic_flag). mb_adaptive_frame_field_flag is a syntax element in the current active SPS and field_pic_flag is a syntax element in the current Slice Header. They both are present only if frame_mbs_only_flag is 0. Although mbaff_frame_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture. It must be consistent with the mb_adaptive_frame_field_flag, the field_pic_flag and the frame_mbs_only_flag settings. This bit is valid only when the img_structure[1:0] indicates the current picture is a frame.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>FALSE</td> <td>not in MBAFF mode</td> </tr> <tr> <td>1</td> <td>TRUE</td> <td>in MBAFF mode</td> </tr> </tbody> </table>	Value	Name	Description	0	FALSE	not in MBAFF mode	1	TRUE	in MBAFF mode			
Value	Name	Description											
0	FALSE	not in MBAFF mode											
1	TRUE	in MBAFF mode											
0	<p>FieldPicFlag Field picture flag, field_pic_flag, specifies the current slice is a coded field or not. It is set to the same value as the syntax element in the Slice Header. It must be consistent with the img_structure[1:0] and the frame_mbs_only_flag settings. Although field_pic_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>FRAME</td> <td>a slice of a coded frame</td> </tr> <tr> <td>1h</td> <td>FIELD</td> <td>a slice of a coded field</td> </tr> </tbody> </table>	Value	Name	Description	0h	FRAME	a slice of a coded frame	1h	FIELD	a slice of a coded field

MFX_AVC_REF_IDX_STATE

MFX_AVC_REF_IDX_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD mode); it is not need in decoder IT mode.</p> <p>The inline data of this command is interpreted differently for encoder as for decoder. For decoder, it is interpreted as RefIdx List L0/L1 as in AVC spec., and it matches with the DXVA2 AVC API data structure for decoder in VLD mode : RefPicList[2][32] (L0:L1, 0:31 RefPic). But for encoder, it is interpreted as a Reference Index Mapping Table for L0 and L1 reference pictures. For packing the bits at the output of PAK, the syntax elements must follow the definition of RefIdxL0/L1 list according to the AVC spec. However, the decoder pipeline was designed to use a variation of that standard definition, as such a conversion (mapping) is needed to support the hardware design.</p> <p>The Reference lists are needed in processing both P and B slice in AVC codec. For P-MB, only L0 list is used; for B-MB both L0 and L1 lists are needed. For a B-MB that is coded in L1-only Prediction, only L1 list is used.</p>			
Programming Notes			
<p>DXVA2 specifies that an application will create the RefPicList L0 and L1 and pass onto the driver. The content of each entry of RefPicList L0/L1[] is a 7-bit picture index. This picture index is the same as that of RefFrameList[] content. This picture index, however, is not defined the same as the frame store ID (0 to 16, 5-bits) we have implemented in H/W. Hence, driver is required to manage a table to convert between DXVA2 picture index and intel frame store ID. As such, the final RefPicList L0/L1[] that the driver passes onto the H/W is not the same as that defined in the DXVA2.</p>

	0	RefPicList Select Num_ref_idx_l1_active is resulted from the specifications in both PPS and Slice Header for the current slice. However, since the full reference list L0 and/or L1 are always sent, only present flags are specified instead. This parameter is specified for Intel interface only, not present in the DXVA.									
		<table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>RefPicList0</td> <td>The list that followed represents RefList L0 (Decoder VLD mode) or Ref Idx Mapping Table L0 (Encoder PAK mode)</td> </tr> <tr> <td>1</td> <td>RefPicList1</td> <td>The list that followed represents RefList L1 (Decoder VLD mode) or Ref Idx Mapping Table L1 (Encoder PAK mode)</td> </tr> </tbody> </table>	Value	Name	Description	0	RefPicList0	The list that followed represents RefList L0 (Decoder VLD mode) or Ref Idx Mapping Table L0 (Encoder PAK mode)	1	RefPicList1	The list that followed represents RefList L1 (Decoder VLD mode) or Ref Idx Mapping Table L1 (Encoder PAK mode)
	Value	Name	Description								
	0	RefPicList0	The list that followed represents RefList L0 (Decoder VLD mode) or Ref Idx Mapping Table L0 (Encoder PAK mode)								
1	RefPicList1	The list that followed represents RefList L1 (Decoder VLD mode) or Ref Idx Mapping Table L1 (Encoder PAK mode)									
2..9	31:0	<p>Reference List Entry</p> <p>This set of fields is always present whenever this command is issued. It always specifies the full 32 reference pictures in the selected list, regardless they are "existing picture" or not. If a picture is non-existing, the corresponding entry should be set to all ones. Each list entry is 1 byte. A 32-bit DW can hold 4 list entries in the following format</p> <ul style="list-style-type: none"> • 31:24 entry X+3 (e.g. listY_3) • 23:16 entry X+2 (e.g. listY_2) • 15:8 entry X+1 (e.g. listY_1) • 7:0 entry X (e.g. listY_0) <p>X is replaced by the paddr[2:0] * 4 ; paddr[5:0] with 0x20 and 0x27, and Y is replaced by 0 or 1. The byte definition for a reference picture :</p> <ul style="list-style-type: none"> • Bit 7 : Non-Existing - indicates that frame store index that should have been at this entry did not exist and was replaced by an index 0 (a valid entry) for error concealment • Bit 6 : Long term bit - set this reference picture to be used as long term reference • Bit 5 : Field picture flag - indicates frame/field • Bit 4:0 : Frame store index or Frame Store ID (Bit 4:1 is used to form the binding table index in intel implementation) <p>This is the final Reference List L0 or L1 after any reordering specified in the Slice Header as well as modified by the driver, and its indices values are all translated to the intel specification. If the reference picture is a frame (Bit5 = 1), frame store ID is always an even number. This list is used in outputting MV information by the BSD unit in VLD mode. DMV access also reads and writes Mvlist0 using this frame store ID. If this set of fields is interpreted as Reference Index Mapping Table L0/L1, the same field alignment is followed, i.e. 4 mapping entries per DW. Each mapping entry is one byte in size, but only the least significant 5 bits [4:0] is relevant. Driver should zero all the upper bits [7:5] for each entry.</p>

MFX_AVC_SLICE_STATE

3:0

CV0 - Clamp Value 0

Format:

U4

If the magnitude of coefficients at locations assigned with CV0 (mapping shown below) exceeds 2^{CV0-1} , they are replaced with 2^{CV0-1} . For coefficients at locations marked as 'none', no clamping is performed. The following mappings are only applied to luma and chroma blocks/subblocks containing AC coefficients (blocks/subblocks with only DC coeffs will not be clamped).

For 4x4 frame block, each coefficient is mapped to one of the eight CV values as following:

none	CV7	CV5	CV4
CV7	CV6	CV4	CV3
CV5	CV4	CV2	CV1
CV4	CV3	CV1	CV0

For 8x8 frame block, each coefficient is mapped to one of the eight CV values as following:

none	none	CV7	CV6	CV5	CV4	CV3	CV3
none	CV7	CV6	CV5	CV4	CV3	CV3	CV2
CV7	CV6	CV5	CV4	CV3	CV3	CV2	CV2
CV6	CV5	CV4	CV3	CV3	CV2	CV2	CV1
CV5	CV4	CV3	CV3	CV2	CV2	CV1	CV1
CV4	CV3	CV3	CV2	CV2	CV1	CV1	CV0
CV3	CV3	CV2	CV2	CV1	CV1	CV0	CV0
CV3	CV2	CV2	CV1	CV1	CV0	CV0	CV0

For 4x4 field block, each coefficient is mapped to one of the eight CV values as following:

none	CV6	CV3	CV1
CV7	CV6	CV3	CV1
CV5	CV4	CV2	CV0
CV5	CV4	CV2	CV0

For 8x8 field block, each coefficient is mapped to one of the eight CV values as following:

none	none	CV6	CV5	CV4	CV3	CV2	CV1
none	CV7	CV6	CV5	CV4	CV3	CV2	CV1
CV7	CV6	CV5	CV4	CV3	CV3	CV2	CV1
CV7	CV6	CV5	CV4	CV3	CV2	CV2	CV1
CV6	CV5	CV4	CV4	CV3	CV2	CV1	CV0
CV6	CV5	CV4	CV3	CV2	CV2	CV1	CV0
CV5	CV5	CV4	CV3	CV2	CV1	CV1	CV0
CV5	CV5	CV4	CV3	CV2	CV1	CV1	CV0

MFX_AVC_WEIGHTOFFSET_STATE

MFX_AVC_WEIGHTOFFSET_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes). However, since for AVC decoder VLD and IT modes, and AVC encoder mode, the implicit weights are computed in hardware, this command is not issued. For encoder, regardless of the type of weight calculation is active for the current slice (default, implicit or explicit), they are all sent to the PAK as if they were all in explicit mode. However, for implicit weight and offset, each entry contains only a 16-bit weight and no offset (offset = 0 always in implicit mode and can be hard-coded inside the hardware).The weights (and offsets) are needed in processing both P and B slice in AVC codec. For P-MB, at most only L0 list is used; for B-MB both L0 and L1 lists may be needed. For a B-MB that is coded in L1-only Prediction, only L1 list is sent.The content of this command matches with the DXVA2 AVC API data structure for explicit prediction mode only : Weights[2][32][3][2] (L0:L1, 0:31 RefPic, Y:Cb:Cr, W:0)</p>

The full table, one entry for each reference picture, is always specified. Any reference list L0/L1[i] that does not exist, the corresponding weight and offset are set to 0. Weight and Offset are 2 byte each. A pair of Weight and Offset forms a dword, with Weight in the LOWER word and Offset in the HIGHER word. WeightOffset[L0=0][i=0 to 31][Y=0] (i.e. luma_weight_I0[i]) are specified for the weighting and offset factors applied to the luma prediction value for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When luma_weight_I0_flag (Slice Header syntax element) is equal to 1, the value of luma_weight_I0[i] shall be in the range of -128 to 127. When luma_weight_I0_flag is equal to 0, luma_weight_I0[i] shall be inferred to be equal to 2luma_log2_weight_denom for RefPicList0[i]. luma_log2_weight_denom is a Slice Header syntax element. WeightOffset[L0=0][i=0 to 31][Cb=1] (i.e. chromaCb_weight_I0[i]) are specified for the weighting and offset factors applied to the chroma Cb prediction values for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When chroma_weight_I0_flag (Slice Header syntax element) is equal to 1, the value of chromaCb_weight_I0[i] shall be in the range of -128 to 127. When chroma_weight_I0_flag is equal to 0, chromaCb_weight_I0[i] shall be inferred to be equal to 2chroma_log2_weight_denom for RefPicList0[i]. chroma_log2_weight_denom is a Slice Header syntax element. WeightOffset[L0=0][i=0 to 31][Cr=2] (i.e. chromaCr_weight_I0[i]) are specified for the weighting and offset factors applied to the chroma Cr prediction values for list 0 prediction using RefPicList0[i] (one-to-one correspondence in i). When chroma_weight_I0_flag (Slice Header syntax element) is equal to 1, the value of chromaCr_weight_I0[i] shall be in the range of -128 to 127. When chroma_weight_I0_flag is equal to 0, chromaCr_weight_I0[i] shall be inferred to be equal to 2chroma_log2_weight_denom for RefPicList0[i].</p>									

MFX_BSP_BUF_BASE_ADDR_STATE

MFX_BSP_BUF_BASE_ADDR_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This frame-level state command is used to specify all the buffer base addresses needed for the operation of the AVC Bit Stream Processing Units (for decoder, it is BSD Unit; for encoder, it is BSE Unit) For both encoder and decoder, currently it is assumed that all codec standards can share the same BSP_BUF_BASE_STATE. The simplicity of this command is the result of moving all the direct MV related processing into the ENC Subsystem. Since all implicit weight calculations and directMV calculations are done in ENC and all picture buffer management are done in the Host, there is no need to provide POC (POC List - FieldOrderCntList, CurrPic POC - CurrFieldOrderCnt) information to PAK. For decoder, all the direct mode information are sent in a separate slice-level command (AVC_DIRECTMODE_STATE command). In addition, in Encoder, the row stores for CABAC encoding and MB Parameters Construction (MPC) are combined into one single row store. The row stores specified in this command do not combine with those specified in the MFC_PIPE_BUF_ADDR_STATE command for hardware simplification reason.</p>

1:0	Age for QUADLRU (AGE) MPR Row Store Scratch Buffer Base Address	
	Project: BDW	
	Format: Enable	
	This field allows the selection of AGE parameter for a given surface in LLC.	
	Value	Name
	11b	Good chance of generating hits.
	10b	Next good chance of generating hits
7	31:6 Bitplane Read Buffer Base Address	
	Project: All	
	It must be cacheline aligned (i.e. 64 bytes address boundary), so lower bit 0 to 5 are used for controlling information. Bitplane buffer is a linear buffer. In VC1 Long format, it is written by an application. In VC1 Short Format, it is written and read by H/W only. For VC1 intel Long Format : it is a read-only buffer. For VC1 DXVA2 Short Format : it is a write and a read buffer. This field is only valid for VC1 decoder mode.

MFX_DBK_OBJECT

8:7	Deblock Row Store - Arbitration Priority Control		BDW
		Project:	
This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.			
		Value	Name
		00b	Highest priority
		01b	Second highest priority
		10b	Third highest priority
		11b	Lowest priority
6:5	Memory Type: LLC Cacheability Control (LeLLCCC) for Deblock Row Store Address		BDW
		Project:	
This is the field used in GT interface block to determine what type of access need to be generated to uncore. For the cases where the LeLLCCC is set, cacheable transaction are generated to enable LLC usage for particular stream.			
		Value	Name
		00b	Use Cacheability Controls from page table / UC with Fence (if coherent cycle)
		01b	Uncacheable (UC) - non-cacheable
		10b	Writethrough (WT)
		11b	Writeback (WB)
4:3	Target Cache (TC) for Deblock Row Store Address		BDW
		Project:	
This field controls the L3\$, LLC cacheability for a given surface. Setting of "00" points to PTE settings which defaults to LLC. Setting of "01", allocates into LLC. Setting of "10" allows the line to be allocated in LLC. Setting of "11" is the only option for a memory access to be allocated in L3\$ as well as LLC			
00b: Reserved			
01b: LLC Only (<i>Works at the allocation time, later victimization from LLC downgrades the line to eLLC if present</i>).			
10b: LLC Allowed.			
11b: L3, LLC Allowed.

MFX_FQM_STATE

MFX_FQM_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a common state command for AVC encoder modes. For encoder, it represents both the forward QM matrices as well as the decoding QM matrices. This is a Frame-level state. Only Scaling Lists specified by an application are being sent to the hardware. The driver is responsible for determining the final set of scaling lists to be used for decoding the current slice, based on the AVC Spec Table 7-2 (Fall-Back Rules A and B). In MFX AVC PAK mode, PAK needs both forward Q scaling lists and IQ scaling lists. The IQ scaling lists are sent as in MFD in raster scan order. But the Forward Q scaling lists are sent in column-wise raster order (column-by-column) to simplify the H/W. Driver will perform all the scan order conversion for both ForwardQ and IQ.</p>

MFX_IND_OBJ_BASE_ADDR_STATE

MFX_IND_OBJ_BASE_ADDR_STATE		
Project:	BDW	
Source:	VideoCS	
Length Bias:	2	
<p>This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers). This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may be applicable only to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculate the corresponding memory location within the frame buffer directly.</p>		
<p>The MFX_IND_OBJ_BASE_ADDR command sets the memory base address pointers for the corresponding Indirect Object Data Start Addresses (Offsets) specified in each OBJECT commands. The characteristic of these indirect object data is their variable size (per MB or per Slice). Hence, each OBJECT command must specify the indirect object data offset from the base address to start fetching or writing object data.</p>		
<p>While the use of base address is unconditional, the indirection can be effectively disabled by setting the base address to zero.</p> <p>For decoder, there are:</p> <ul style="list-style-type: none"> • 1 read-only per-slice indirect object in the BSD_OBJECT Command, and • 2 read-only per-MB indirect objects in the IT_OBJECT Command. <p>For decoder: the Video Command Streamer (VCS) will perform the memory access bound check automatically using the corresponding MFC Indirect Object Access Upper Bound specification. If any access is at or beyond the upper bound, zero value is returned. The request to memory is still being sent, but the corresponding codec's BSD unit will detect this condition and perform the zeroing return. If the Upper Bound is turned off, the beyond bound request will return whatever on the bus (invalid data).</p> <p>For encoder, there are:</p> <ul style="list-style-type: none"> • 1 read-only per-MB indirect object in the PAK_OBJECT Command, and • 1 write-only per-slice indirect object in the PAK Slice_State Command <p>For encoder: whenever an out of bound address accessing request is generated, VMX will detect such requests and snap the address to the corresponding [indirect object base address + indirect data start address]. VMX will return all 0s as the data to the requestor. Notation: $PhysicalAddress[n:m]$ Corresponding bits of a physical graphics memory byte address (not mapped by a GTT) $GraphicsAddress[n:m]$ Corresponding bits of an absolute, virtual graphics memory byte address (mapped by a GTT).</p>

	10b	Next good chance of generating hits
9	31:12 MFX Indirect MV Object Access Upper Bound	
	Format: GraphicsAddress[31:12]	
This field specifies the 4K-byte aligned (exclusive) maximum Graphics Memory address access by the indirect data object in the MFC_AVC_PAK_OBJECT / MFD_IT_OBJECT command for the per-MB MV data. Indirect data accessed at this address and beyond will return as 0 by the hardware. Setting this field to 0 will cause this range check to be ignored.If non-zero, this address must be greater than the MFX Indirect MV Object Base Address state.Hardware ignores this field if indirect data is not present, i.e. the Indirect Data Length field of the MFC_AVC_PAK_OBJECT / MFD_IT_OBJECT command is set to 0.This field is only valid in AVC encoder mode or in AVC decoder IT mode.		
11:0	Reserved	
	Format: MBZ	
10	31:16 Reserved	
	Project: All	
	Format: MBZ	
	Reserved for 64-bit address extension.	
15:0	MFX Indirect MV Object UpperBound [47:32]	
	Project: All	
	Description	
	This field is for the upper range of MFX Indirect MV Object Base Address. This field is used for 48-bit addressing.	
11	31:12 MFD Indirect IT-COEFF Object - Base Address (Decoder Only)	
	Format: GraphicsAddress[31:12]	
	Specifies the 4K-byte aligned memory base address for the read-only indirect data object pointed in the MFD_IT_OBJECT command for fetching (reading) the per-MB non-scaled coefficient data (all inverse scaling and quantization are done in hardware).This field is only valid in MPEG2, AVC and VC1 decoder IT mode.

11	<p>TFF (Top Field First) When two fields are stored in a picture, this bit indicates if the top field is the first field.For a frame P picture, the value 1 indicates that the top field of the reconstructed frame is the first field output by the decoding process, the same as defined in ISO/IEC 13818-2 6.3.10. Particularly, it is used by the hardware to calculate derivative motion vectors from the dual-prime motion vectors.For a field P picture, hardware uses this bit together with the Picture Structure to determine if the current picture is the Second Field. In this case, the definition of this bit differs from ISO/IEC 13818-2 6.3.10 - software must derive the value for this bit according to the following relation:Picture Structure = top fieldPicture Structure = bottom fieldSecond Field = 0TFF = 1TFF = 0Second Field = 1TFF = 0TFF = 1</p>

	- Minimum Frame Size [15:0] (16-bit) (Encoder Only) Minimum Frame Size is specified to compensate for intel Rate Control Currently zero fill (no need to perform emulation byte insertion) is done only to the end of the CABAC_ZERO_WORD insertion (if any) at the last slice of a picture. Intel encoder parameter, not part of DXVA. The caller should always make sure that the value, represented by Minimum Frame Size, is always less than maximum frame size FrameBitRateMax (DWORD 10 bits 29:16). This field is reserved in Decode mode.

MFX_PAK_INSERT_OBJECT

MFX_PAK_INSERT_OBJECT	
Project:	BDW
Source:	VideoCS
Length Bias:	2
Description	
<p>The MFX_PAK_INSERT_OBJECT command is the first primitive command for the AVC, MPEG2 Encoding Pipeline.</p> <p>This command is issued to setup the control and parameters of inserting a chunk of compressed/encoded bits into the current bitstream output buffer starting at the specified bit location to perform the actual insertion by transferring the command inline data to the output buffer max, 32 bits at a time.</p> <p>It is a variable length command as the data to be inserted are presented as inline data of this command. It is a multiple of 32-bit (1 DW), as the data bus to the bitstream buffer is 32-bit wide.</p> <p>Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid H.264 bitstream.</p> <p>Internally, MFX hardware will keep track of the very last two bytes' (the very last byte can be a partial byte) values of the previous insertion. It is required that the next Insertion Object Command or the next PAK Object Command to perform the start code emulation sequence check and prevention 0x03 byte insertion with this end condition of the previous insertion. Hardware will keep track of an output bitstream buffer current byte position and the associated next bit insertion position index. Data to be inserted can be a valid H.264 NAL units or a partial NAL unit. Certain NAL unit has a minimum byte size requirement. As such the hardware will optionally (enabled by STATE Command) determines the number of CABAC_ZERO_WORD to be inserted to the end of the current NAL, based on the minimum byte size of a NAL and the actual bin count of the encoded Slice. Since prior to the CABAC_ZERO_WORD insertion, the RBSP or EBSP is already byte-aligned, so each CABAC_ZERO_WORD insertion is actually a 3-byte sequence 0x00 00 03. The inline data may have already been processed for start code emulation byte insertion, except the possibility of the last 2 bytes plus the very last partial byte (if any). Hence, when hardware performing the concatenation of multiple consecutive insertion commands, or concatenation of an insertion command and a PAK object command, it must check and perform the necessary start code emulation byte insert at the junction. The inline data is required to be byte aligned on the left (first transmitted bit order) and may or may not be byte aligned on the right (last transmitted bits). The command will specify the bit offset of the last valid DW. Each insertion state command defines a chunk of bits (compressed data) to be inserted at a specific location of the output compressed bitstream in the output buffer. Depend on CABAC or CAVLC encoding mode (from Slice State), PAK Object Command is always ended in byte aligned output bitstream except for CABAC header insertion which is bit aligned. In the aligned cases, PAK will perform 0 filling in CAVLC mode, and 1 filling in CABAC mode.</p> <p>Insertion data can include: any encoded syntax elements bit data before the encoded Slice Data (PAK Object Command) of the current Slice SPS NAL PPS NAL SEI NAL Other Non-Slice NAL Leading_Zero_8_bits (as many bytes as there is) Start Code Prefix NAL Header Byte Slice Header Any encoded syntax elements bit data after the encoded Slice Data (PAK Object Command) of the current Slice and prior to the next encoded Slice Data of the next Slice or prior to the end of the bitstream, whichever comes first Cabac_Zero_Word or Trailing_Zero_8bits (as many bytes as there is).</p> <p>Anything listed above before a Slice Data Context switch interrupt is not supported by this command.</p>

		Value	Name	Description							
1	RESET	Reset the bitstream buffer insertion position to the bitstream buffer starting position.									
0	INSERT	Insert the current command inline data starting at the current bitstream buffer insertion position									
2..n	31:0	Insert Data Payload Actual Data to be inserted to the output bitstream buffer.									

MFX_PIPE_BUF_ADDR_STATE

MFX_PIPE_BUF_ADDR_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers). This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may only applicable to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculated the corresponding memory location within the frame buffer directly.</p>

MFX_QM_STATE

MFX_QM_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a common state command for AVC encoder modes. For encoder, it represents both the forward QM matrices as well as the decoding QM matrices. This is a Frame-level state. Only Scaling Lists specified by an application are being sent to the hardware. The driver is responsible for determining the final set of scaling lists to be used for decoding the current slice, based on the AVC Spec Table 7-2 (Fall-Back Rules A and B). In MFX AVC PAK mode, PAK needs both forward Q scaling lists and IQ scaling lists. The IQ scaling lists are sent as in MFD in raster scan order. But the Forward Q scaling lists are sent in column-wise raster order (column-by-column) to simplify the H/W. Driver will perform all the scan order conversion for both ForwardQ and IQ.</p>

MFX_STATE_POINTER

MFX_STATE_POINTER

Project: BDW
 Source: VideoCS
 Length Bias: 2

The MFX_STATE_POINTER command, issued at picture level, is used to set up the indirect pointers for VCS to fetch all the MFX states (Image state, Slice state, etc.) needed for the encoding/decoding process in PAK/IT mode. The encoding/decoding states are presented by state commands, which are grouped into separate sets (picture level, slice level, etc.), and each is stored in its own memory buffer referred by an indirect state pointer. The content of each indirect state buffer is a list of MFX state commands with no special format requirements. The sequence of commands in each indirect state buffer is terminated by a MI_BATCH_BUFFER_END command (acts as the last command marker). Therefore, indirect state buffers can have different and variable length of command sequences.

The indirection is designed to facilitate context switching in the middle of a codec operation. The smallest granularity of interruption is designed to be at a completed MB row in AVC/VC1/MPEG2 IT and AVC PAK operating modes as well as in VC1/MPEG2 VLD mode. There is no support for context switch in AVC VLD mode. Hardware supports up to 4 separate indirect state pointers, allowing software to manage the grouping of state commands. During context switch, hardware restores (re-issues) the latest version of each indirect state pointer, if present.

MFX_STATE_POINTER command can only program one indirect state pointer at a time. MI_FLUSH will invalidate all indirect state buffer pointers inside VCS.

MFX_STITCH_OBJECT

MFX_STITCH_OBJECT				
Project:	BDW			
Source:	VideoCS			
Length Bias:	2			
<p>The MFC_STITCH_OBJECT command is used when stitch-enabled is set to 1, while CodecSel and StandardSel are set to ENCODE and AVC, respectively. This command is used, for example, to stitch multiple bitstreams to form a transport stream.</p> <p>It is a variable length command as the data to be inserted are presented as either inline data and/or indirect data of this command. Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid output. Hardware keeps track of an output bitstream buffer current byte position and the associated next bit insertion position index. Context switch interrupt is not supported by this command.</p>

	2 Last Source Header Data Insert Command Flag To process a series of consecutive insertion commands, this flag (=1) indicates the current command is the last 'header' insertion in the series. In CABAC, hardware must perform the "1" insert for byte align for Slice Header before Slice Data comes in in the next PAK-OBJECT command. In CAVLC, hardware ignores this bit.				
	1 Last Destination Data Insert Command Flag THIS FIELD MUST BE THE SAME AS Last Source Header Data Insert Command Flag No more insertion command and no more PAK-OBJECT command follows. Flush data out to memory				
0 Reserved					
2	31:19 Reserved				
	Format: MBZ				
	18:0 Indirect Data Length Project: BDW Format: U19 This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. This field must have the same alignment as the Indirect Object Data Start Address.				
3	31:0 Indirect Data Start Address Format: MfxIndirectBitstreamObjectAddress[31:0] This field specifies the Graphics Memory starting address of the data to be loaded into the kernel for processing. This pointer is relative to the MFX Indirect Bitstream Object Base Address. Hardware ignores this field if indirect data is not present.				
	4..n Insert Data Payload Inline data to be inserted to the output bitstream buffer				

MFX_SURFACE_STATE

MFX_SURFACE_STATE	
Project:	BDW
Source:	VideoCS
Length Bias:	2
<p>This command is common for all encoding/decoding modes, to specify the uncompressed YUV picture (i.e. destination surface) or intermediate streamout in/out surface (e.g. coefficient/residual) (field, frame or interleaved frame) format for reading and writing:</p> <ul style="list-style-type: none"> • Uncompressed, original input picture to be encoded • Reconstructed non-filtered/filtered display picture (becoming reference pictures as well for subsequent temporal inter-prediction) <p>Since there is only one media surface state being active during the entire encoding/decoding process, all the uncompressed/reconstructed pictures are defined to have the same surface state. For each media object call (decoding or encoding), to distinguish among them, a surfaceID is added to specify for each type of surface. The primary difference among picture surface states is their individual programmed base addresses, which are provided by other state commands and not included in this command. MFX engine is making the association of surface states and corresponding buffer base addresses.</p> <p>MFX engine currently supports only one media surface type for video and that is the NV12 (Planar YUV420 with interleaved U (Cb) and V (Cr)). For optimizing memory efficiency based on access patterns, only TileY is supported. For JPEG decoder, only IMC1 and IMC3 are supported. Pitch can be wider than the Picture Width in pixels and garbage will be there at the end of each line. The following describes all the different formats that are supported and not supported in Gen7 MFX :</p> <ul style="list-style-type: none"> • NV12 - 4:2:0 only; UV interleaved; Full Pitch, U and V offset is set to 0 (the only format supported for video codec); vertical UV offset is MB aligned; UV xoffsets = 0. JPEG does not support NV12 format because non-interleave JPEG has performance issue with partial write (in interleaved UV format) • IMC 1 & 3 - Full Pitch, U and V are separate plane; (JPEG only; U plane + garbage first in full pitch followed by V plane + garbage in full pitch). U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes. IMC1 and IMC3 are different by a swap of U and V. This is the only format supported in JPEG for all video subsampling types (4:4:4, 4:2:2 and 4:2:0) • We are not supporting IMC 2 & 4 - Full Pitch, U and V are separate plane (JPEG only; U plane first in full pitch followed by V plane in full pitch - U and V plane are side-by-side). U and V vertical offsets are 16-pixel aligned; V xoffset is half-pitch aligned; U xoffset is 0; there is no gap between Y, U and V planes. IMC2 and IMC4 are different by a swap of U and V. • We are not supporting YV12 - half pitch for each U and V plane, and separate planes for Y, U and V (U plane first in half pitch followed by V plane in half pitch). For YV12, U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes <p>Note that the following data structures are not specified through the media surface state</p> <ul style="list-style-type: none"> • 1D buffers for row-store and other miscellaneous information. • 2D buffers for per-MB data-structures (e.g. DMV biffer, MB info record, ILDB Control and Tcoeff/Stocoeff). <p>This surface state here is identical to the Surface State for deinterlace and sample_8x8 messages described in the Shared Function Volume and Sampler Chapter.</p> <p>For non pixel data, such as row stores, indirect data (Compressed Slice Data, AVC MV record, Coeff record and AVC ILDB record) and streamin/out and output compressed bitstream, a linear buffer is employed. For row stores, the H/W is designed to guarantee legal memory accesses (read and write). For the remaining cases,</p>	

MFX_SURFACE_STATE

indirect object base address, indirect object address upper bound, object data start address (offset) and object data length are used to fully specified their corresponding buffer. This mechanism is chosen over the pixel surface type because of their variable record sizes.

All row store surfaces are linear surface. Their addresses are programmed in Pipe_Buf_Base_State or Bsp_Buf_Base_Addr_State

Programming Notes

VC1 I picture scaling: Even though VC1 allows I reconstructed picture scaling (via RESPIC), as such scaling is only allowed at I picture. All subsequent P (and B) pictures must have the same picture dimensions with the preceding I picture. Therefore, all reference pictures for P or B picture can share the same surface state with the current P and B picture. Note : H/W is not processing RESPIC. Application is no longer expecting intel decoder pipeline and kernel to perform this function, it is going to be done in the video post-processing scaler or display controller scale as a separate step and controller.

All video codec surfaces must be NV12 Compliant, except JPEG. U/V vertical must be MB aligned for all video codec (further constrained for field picture), but JPEG can be block aligned. All video codec and JPEG uses Tiled - Y format only, for uncompressed pixel surfaces.

Even for JPEG planar 420 surface, application may provide only 1 buffers, but there is still only one single surface state for all of them. If IMC equal to 1, 2, 3 or 4, U and V have the pitch same as Y. And U and V will have different offset, each offset is block aligned.

MFX_SURFACE_STATE		
19:3	Surface Pitch	
	Format:	U17-1 pitch in Bytes
	This field specifies the surface pitch in (#Bytes).	
	Value	Name
	[0,2047]	to [1B, 2048B]
Programming Notes		
For tiled surfaces, the pitch must be a multiple of the tile width (i.e.128 bytes aligned). If Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.For Y-tiled surfaces: Range = [127, 524287] to [128B,256KB] = [1 tile, 2048 tiles]		
2	Half Pitch for Chroma	
	Format:	Enable
(This field must be set to Disable)This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.This field is ignored by MFX (unless we support YV12)		
1	Tiled Surface	
	Format:	Boolean
	(This field must be set to TRUE: Tiled)This field specifies whether the surface is tiled.This field is ignored by MFX	
	Value	Name
		0
	1	True
Programming Notes		
Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled surfaces can only be mapped to Main Memory.The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.

6:5	Memory Type: LLC Cacheability Control (LeLLCCC) for Direct MV Read Buffer for the Current Picture	Project: BDW	This is the field used in GT interface block to determine what type of access need to be generated to uncore. For the cases where the LeLLCCC is set, cacheable transaction are generated to enable LLC usage for particular stream.										
			<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Value</th> <th style="width: 85%;">Name</th> </tr> </thead> <tbody> <tr> <td>00b</td> <td>Use Cacheability Controls from page table / UC with Fence (if coherent cycle)</td> </tr> <tr> <td>01b</td> <td>Uncacheable (UC) - non-cacheable</td> </tr> <tr> <td>10b</td> <td>Writethrough (WT)</td> </tr> <tr> <td>11b</td> <td>Writeback (WB)</td> </tr> </tbody> </table>	Value	Name	00b	Use Cacheability Controls from page table / UC with Fence (if coherent cycle)	01b	Uncacheable (UC) - non-cacheable	10b	Writethrough (WT)	11b	Writeback (WB)
Value	Name												
00b	Use Cacheability Controls from page table / UC with Fence (if coherent cycle)												
01b	Uncacheable (UC) - non-cacheable												
10b	Writethrough (WT)												
11b	Writeback (WB)												
4:3	Target Cache (TC) for Direct MV Read Buffer for the Current Picture	Project: BDW	This field controls the L3\$, LLC cacheability for a given surface. Setting of "00" points to PTE settings which defaults to LLC. Setting of "01", allocates into LLC. Setting of "10" allows the line to be allocated in LLC. Setting of "11" is the only option for a memory access to be allocated in L3\$ as well as LLC 00b: Reserved 01b: LLC Only (<i>Works at the allocation time</i>). 10b: LLC Allowed. 11b: L3, LLC Allowed.										
			<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 25%;">Value</th> <th style="width: 75%;">Name</th> </tr> </thead> <tbody> <tr> <td>00b</td> <td>Reserved</td> </tr> <tr> <td>01b</td> <td>LLC Only</td> </tr> <tr> <td>10b</td> <td>LLC Allowed</td> </tr> <tr> <td>11b</td> <td>L3, LLC Allowed</td> </tr> </tbody> </table>	Value	Name	00b	Reserved	01b	LLC Only	10b	LLC Allowed	11b	L3, LLC Allowed
Value	Name												
00b	Reserved												
01b	LLC Only												
10b	LLC Allowed												
11b	L3, LLC Allowed												
2	Reserved	Project: BDW											
		Format: Enable											
1:0	Age for QUADLRU (AGE) for Direct MV Read Buffer for the Current Picture	Project: BDW											
		Format: Enable											
			This field allows the selection of AGE parameter for a given surface in LLC. If a particular allocation is done at youngest age ("0,1,2") it tends to stay longer in the cache. This option is given to GFX software to be able to decide which surfaces are more likely to generate HITS, hence need to be replaced least often in caches.										
			<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Value</th> <th style="width: 85%;">Name</th> </tr> </thead> <tbody> <tr> <td>11b</td> <td>Good chance of generating hits.</td> </tr> <tr> <td>10b</td> <td>Next good chance of generating hits</td> </tr> <tr> <td>01b</td> <td>Decent chance of generating hits</td> </tr> <tr> <td>00b</td> <td>Poor chance of generating hits.</td> </tr> </tbody> </table>	Value	Name	11b	Good chance of generating hits.	10b	Next good chance of generating hits	01b	Decent chance of generating hits	00b	Poor chance of generating hits.
Value	Name												
11b	Good chance of generating hits.												
10b	Next good chance of generating hits												
01b	Decent chance of generating hits												
00b	Poor chance of generating hits.												

MFX_VC1_PRED_PIPE_STATE

MFX_VC1_PRED_PIPE_STATE			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>This command is used to set the operating states of the MFD Engine beyond the BSD unit. It is used with both VC1 Long and Short format. Driver is responsible to take the intensity compensation enable signal, the LumScale and the LumShift provided from the DXVA2 VC1 interface, and maintain a history of these values for reference pictures. Together with these three parameters specified for the current picture being decoded, driver will derive and supply the above sets of LumScaleX, LumShiftX and intensity compensation enable (single or double, forward or backward) signals. H/W is responsible to take these state values, and use them to build the lookup table (including the derivation of iScale and iShift) for remapping the reference frame pixels, as well as performing the actual pixel remapping calculations/process.</p>

MFX_VP8_PAK_OBJECT

MFX_VP8_PAK_OBJECT			
Project:	BDW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFX_VP8_PAK_OBJECT command is the second primitive command for the VP8 Encoding Pipeline. The MV Data portion of the bitstream is loaded as indirect data object. Before issuing a MFX_VP8_PAK_OBJECT command, all VP8 MFX states need to be valid; therefore the commands used to set these states need to have been issued prior to the issue of this command. MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the first MB. MFX_VP8_PAK_OBJECT command follows the MbType definition like MFD. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.</p>

MI_ARB_CHECK

MI_ARB_CHECK			
Project:	BDW		
Source:	RenderCS		
Length Bias:	1		
Description			
<p>The MI_ARB_CHECK instruction is used to check the ring buffer double buffered head pointer (register UHPTR). This instruction can be used to pre-empt the current execution of the ring buffer. Note that the valid bit in the updated head pointer register needs to be set for the command streamer to be pre-empted.</p>			
Programming Notes			
<p>Ring Buffer mode of scheduling:</p> <ul style="list-style-type: none"> The current head pointer is loaded with the updated head pointer register independent of the location of the updated head. If the current head pointer and the updated head pointer register are equal, hardware will automatically reset the valid bit corresponding to the UHPTR. For pre-emption, the wrap count in the ring buffer head register is no longer maintained by hardware. The hardware updates the wrap count to the value in the UHPTR register. <p>Execlist mode of scheduling: MI_ARB_CHK will be used to indicate a command boundary on which Preemption will be honored by Command Streamer in the execlist mode of operation. UHPTR is ignored when processing MI_ARB_CHK in execlist mode.</p> <p>This instruction can be in either a ring buffer or batch buffer.</p> <p>MI_ARB_CHK command must not be programmed in INDIRECT_CTX and BB_PER_CTX_PTR buffers.</p>

MI_ARB_ON_OFF

MI_ARB_ON_OFF		
Project:	BDW	
Source:	CommandStreamer	
Length Bias:	1	
<p>The MI_ARB_ON_OFF instruction is used to disable/enable context switching. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command. This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.) This command should always be used as an off-on pair with the sequence of instructions to be protected from context switch between MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.</p>		
<p>Execution List Mode of Scheduling: The MI_ARB_ON_OFF instruction is used to disable/enable context switching. Context switching could be either due to preemption or un-succesfull wait for events or semaphore waits. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command. This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.)</p> <p>Ring Buffer Mode of Scheduling: The MI_ARB_ON_OFF instruction is used to disable preemption on the preemptable commands. SW can explicitly make section of commands in a command buffer non-preemptable by sandwiching them between ARB_OFF and ARB_ON, HW will ignore preemption request (UHPTR Valid) until arbitration is enabled.</p>		
Programming Notes		
<p>This command must be always be programmed in pairs of off/on in the same command dispatch. Sequence of instructions to be protected from cntext switch or preemption must be programmed between the MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.</p>		
<p>HW doesn't treat Arbitration Disabled as equivalent to "Inhibit Synchronous Context Switch" set in CTXT_SR_CTL register. Power management optimizations (RDOP on WT4EVT) available on setting "Inhibit Synchronous Context Switch" are not enabled by default on Arbitration Disabled. SW must explicitly program "Inhibit Synchronous Switch" when Arbitration Disabled to enable power management optimizations.</p>

MI_ATOMIC

MI_ATOMIC											
Project:	BDW										
Source:	PRM										
Length Bias:	2										
Description											
<p>MI_ATOMIC is used to carry atomic operation on data in graphics memory. Atomic operations are supported on data granularity of 4B, 8B and 16B. The atomic operation leads to a read-modify-write operation on the data in graphics memory with the option of returning value. The data in graphics memory is modified by doing arithmetic and logical operation with the inline/indirect data provided with the MI_ATOMIC command. Inline/Indirect provided in the command can be one or two operands based on the atomic operation. Ex: Atomic-Compare operation needs two operands while Atomic-Add operation needs single operand and Atomic-increment requires no operand. Refer Vol1i L3 URB [BDW] B-spec for detailed atomic operations supported. Atomic operations can be enabled to return value by setting "Return Data Control" field in the command, return data is stored to CS_GPR registers. CS_GPR4/5 registers are updated with memory Return Data based on the "Data Size". Each GPR register is qword in size and occupies two MMIO registers. Note: Any references to CS_GPR registers in the command should be understood as the CS_GPR registers belonging to the corresponding engines *CS_GPR registers.</p> <table border="1"> <thead> <tr> <th>Engine Name</th> <th>Corresponding GPR Registers</th> </tr> </thead> <tbody> <tr> <td>RCS</td> <td>CS_GPR</td> </tr> <tr> <td>BCS</td> <td>BCS_GPR</td> </tr> <tr> <td>VCS</td> <td>VCS_GPR</td> </tr> <tr> <td>VECS</td> <td>VECS_GPR</td> </tr> </tbody> </table> <p>Indirect Source Operands: Operand1 is sourced from [CS_GPR1, CS_GPR0] Operand2 is sourced from [CS_GPR3, CS_GPR2] Read return Data is stored in [CS_GPR_5, CS_GPR4]</p> <ul style="list-style-type: none"> When "Data Size" is QWORD or DWORD only CS_GPR4 (Qword) is updated with the qword data returned from memory. When the data size is OCTWORD CS_GPR4/5 are updated with the OCTWORD data returned from memory. CS_GPR4 is loaded with lower qword returned from memory and CS_GPR5 is loaded with upper qword returned from memory. 			This bit will be ignored and treated as if clear when executing from a non-privileged batch buffer. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer. This bit must be 1 if the Per Process GTT Enable bit is clear.		
			Value	Name	Description
			0h	Per Process Graphics Address	
1h			Global Graphics Address	This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.	
21	21	Reserved			
		Source:	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS		
		Format:	MBZ		
21	21	Post-Sync Operation			
		Source:	RenderCS		
		Value	Name	Description	
		0h	No Post Sync Operation	Command is executed as usual.	

MI_ATOMIC

1h	Post Sync Operation	<p>MI_ATOMIC command is executed as a pipelined PIPE_CONTROL flush command with Atomics operation as post sync operation. Flush completion only guarantees the workload prior to this command is pushed till Windower unit and completion of any outstanding flushes issued prior to this command.</p> <p>When this bit set following restrictions apply to atomic operation:</p> <ul style="list-style-type: none"> • Non-Compare atomic operations are supported on data granularity of 4B and 8B. DW3 is the lower dword of the operand and DW4 is the upper dword of the operand for the atomic operation. • Compare atomic operations are supported on data granularity of 4B. DW3 is Operand-0 and DW4 is Operand-1 for the atomic operation. • Atomic operations to GGTT/PPGTT memory surface are supported. • Only Inline data mode for atomic operand is supported, no support for indirect data mode. • No support for Return Data Control functionality. • No support for atomic operations on data granularity of 16B. • No support for compare atomic operations on data granularity of 8B.
----	---------------------	---

Programming Notes

Any desired pipeline flush operation can be achieved by programming PIPE_CONTROL command prior to this command.

When this bit is set Command Streamer sends a flush down the pipe and the atomic operation is saved as post sync operation. Command streamer goes on executing the following commands. Atomic operation saved as post sync operation is executed at some point later on completion of corresponding flush issued.

When this bit is set atomic semaphore signal operation will be out of order with rest of the MI commands programmed in the ring buffer or batch buffer, it will be in order with respect to the post sync operations resulting due to PIPE_CONTROL command.

Workaround

Workaround: "Post Sync Operation" bit must not be set when MI_ATOMIC command is programmed by GPGPU and MEDIA workloads (i.e when PIPELINE_SELECT command is set to GPGPU or MEDIA). This is to WA FFDOP CG issue, this WA need not be implemented when FF_DOP_CG is disabled via "Fixed Function DOP Clock Gate Disable" bit in RC_PSMI_CTRL register.

20:19	<p>Data Size</p> <p>This field indicates the size of the operand in dword/qword/octword on which atomic operation will be performed. Data size must match with the Atomic Opcode. Operation Data size could be 4B, 8B or 16B</p>

MI_BATCH_BUFFER_START

MI_BATCH_BUFFER_START				
Project:	BDW			
Source:	RenderCS			
Length Bias:	2			
<p>The MI_BATCH_BUFFER_START command is used to initiate the execution of commands stored in a <i>batch</i> buffer. For restrictions on the location of batch buffers, see Batch Buffers in the Device Programming Interface chapter of <i>MI Functions</i>. The batch buffer can be specified as privileged or non-privileged, determining the operations considered valid when initiated from within the buffer and any attached (chained) batch buffers. See Batch Buffer Protection in the Device Programming Interface chapter of <i>MI Functions</i>.</p>				
Programming Notes				
<ul style="list-style-type: none"> A batch buffer initiated with this command must end either with a MI_BATCH_BUFFER_END command or by chaining to another batch buffer with an MI_BATCH_BUFFER_START command. It is essential that the address location beyond the current page be populated inside the GTT. HW performs over-fetch of the command addresses and any over-fetch requires a valid TLB entry. A single extra page beyond the batch buffer is sufficient. 				
DWord	Bit	Description		
0	31:29	Command Type		
		Default Value:	0h MI_COMMAND	
		Format:	OpCode	
	28:23	MI Command Opcode		
		Default Value:	31h MI_BATCH_BUFFER_START	
		Format:	OpCode	
	22	2nd Level Batch Buffer		
		The command streamer contains three storage elements; one for the ring head address, one for the batch head address, and one for the 2nd level batch head address. When performing batch buffer chaining, hardware simply updates the head pointer of the 1st level batch address storage. There is no stack in hardware. When this bit is set, hardware uses the 2nd level batch head address storage element. Upon MI_BATCH_BUFFER_END, it will automatically return to the 1st (traditional) level batch buffer address. this allows hardware to mimic a simple 3-level stack.		
		Value	Name	Description
		0h	1st level batch	Place the batch buffer address in the 1st (traditional) level batch address storage element.
1h		2nd level batch	Place the batch buffer address in the 2nd-level batch address storage element.	
Programming Notes				
Within a second level batch buffer there can't be any chained batch buffers. MI_BATCH_BUFFER_START command is not allowed inside a second level batch buffer.

MI_CONDITIONAL_BATCH_BUFFER_END

DWord		Bit	Description
Project:		BDW	
Source:		BlitterCS	
Length Bias:		2	
<p>The MI_CONDITIONAL_BATCH_BUFFER_END command is used to conditionally terminate the execution of commands stored in a batch buffer initiated using a MI_BATCH_BUFFER_START command. Termination of second level batch buffer due to this command will also terminate the parent/first level batch buffer.</p>			
0	31:29	Command Type	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	MI Command Opcode	
		Default Value:	36h MI_CONDITIONAL_BATCH_BUFFER_END
		Format:	OpCode
	22	Use Global GTT	
		Default Value:	0h
		Format:	Boolean
	<p>If set, this command uses the global GTT to translate the Compare Address and this command must be executing from a privileged (secure) batch buffer. If clear, the PPGTT is used to translate the Compare Address.</p>		
21	Compare Semaphore		
	Default Value:	0h	
	Format:	Boolean	
<p>If set, the value from the Compare Data Dword is compared to the value from the Compare Address in memory. If the value at Compare Address is greater than the Compare Data Dword, execution of the current command buffer should continue. If clear, the parser will continue to the next command and not exit the batch buffer.</p>			
20	Reserved

MI_COPY_MEM_MEM

MI_COPY_MEM_MEM			
Project:	BDW		
Source:	VideoEnhancementCS		
Length Bias:	2		
<p>The MI_COPY_MEM_MEM command reads a DWord from memory and stores the value of that DWord to back to memory. The source and destination addresses are specified in the command. The command temporarily halts command execution.</p>			
Programming Note			
<p>This command should not be used within a "non_privilege" batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or privilege batch buffers to access global virtual space.</p>

MI_DISPLAY_FLIP

MI_DISPLAY_FLIP	
Project:	BDW
Source:	BlitterCS
Length Bias:	2
<p>The MI_DISPLAY_FLIP command is used to request a specific display plane to switch (flip) to display a new buffer. The buffer is specified with a starting address and pitch. The tiled attribute of the buffer start address is programmed as part of the packet.</p>	
<p>The operation this command performs is also known as a "display flip request" operation - in that the flip operation itself will occur at some point in the future. This command specifies when the flip operation is to occur: either synchronously with vertical retrace to avoid tearing artifacts</p>	
Programming Notes	
<p>This command simply requests a display flip operation -- command execution then continues normally. There is no guarantee that the flip (even if asynchronous) will occur prior to subsequent commands being executed. (Note that completion of the MI_FLUSH_DW command does not guarantee that outstanding flip operations have completed). The MI_WAIT_FOR_EVENT command must be used to provide this synchronization to avoid back to back MI_DISPLAY_FLIP commands to the same display plane - by pausing command execution until a pending flip has actually completed. This synchronization can also be performed by use of the Display Flip Pending hardware status. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.</p>	
<p>After a display flip operation is requested, software is responsible for initiating any required synchronization with subsequent buffer clear or blitter operations. For multi-buffering (e.g., double buffering) operations, this will typically require updating SURFACE_STATE or the binding table to change the blitter (back) buffer. In addition, prior to any subsequent clear or blitter operations, software must typically ensure that the new blitter buffer is not actively being displayed. Again, the MI_WAIT_FOR_EVENT command or Display Flip Pending hardware status can be used to provide this synchronization. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.</p>	
<p>The display buffer command uses the X and Y offset for the tiled buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For tiled buffers, the display subsystem uses the X and Y offset in generation of the final request to memory. The offset is always updated on the next vblank for both Synchronous and Asynch Flips. It is not necessary to have a flip enqueued to update the X and Y offset</p>	
<p>The display buffer command uses the linear DWord offset for the linear buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For linear buffers, the display subsystem uses the Dword offset in generation of the final request to memory.</p> <ul style="list-style-type: none"> • For synchronous flips the offset is updated on the next vblank. It is not necessary to have a sync flip enqueued to update the DWord offset. • Linear memory does not support asynchronous flips. 	
<p>Events must be unmasked in the Display Engine Render Response Mask Register (DE RRMR 0x44050) prior to waiting for them with a MI_WAIT_FOR_EVENT command, or in the case of flips or scanlines, prior to starting the flip or loading the scanline. Unmasked events will wake command streamer as they occur, so for improved power savings it is recommended to only unmask events that are required. Programming the DE RRMR register can be done through MMIO or a LOAD_REGISTER_IMMEDIATE command.</p>	

MI_DISPLAY_FLIP				
DWord	Bit	Description		
0	31:29	Command Type

MI_LOAD_REGISTER_MEM

MI_LOAD_REGISTER_MEM	
Project:	BDW
Source:	RenderCS, BlitterCS, VideoCS, VideoEnhancementCS
Length Bias:	2
The MI_LOAD_REGISTER_MEM command requests from a memory location and stores that DWord to a register.	

Programming Notes	
The command temporarily halts commands that will cause cycles down the 3D pipeline.	
The following addresses should NOT be used for MMIO writes: <ul style="list-style-type: none"> • 0x8800 - 0x88FF • >= 0xC0000 Limited MMIO writes cycles to the Display Engine 0x40000-0xBFFFF) are allowed, but must be spaced to allow only one pending at a time. This can be done by issuing an SRM to the same address immediately after each MMIO write.	
Any updates to the memory location exercised by this command must be ensured to be coherent in memory prior to programming of this command. This must be achieved by programming MI_ATOMIC (write to scratch space) with "CS STALL" set prior to programming of this command. Example: MI_STORE_REGISTER_MEM (0x2288, 0x2CF0_0000) MI_ATOMIC (MOV, Dummy data, Scratch Address) MI_LOAD_REGISTER_MEM(0x2288, 0x2CF0_0000)	
This command should not be used within a non-privilege batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation.	
This command is not allowed to update the privilege register range when executed from a non-privilege batch buffer.	
Writes to the range 0x9400-0x97FF must be either be avoided, or serialized with a read (e.g. STORE_REGISTER_MEM) between them.	

DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	MI Command Opcode	
		Default Value:	29h MI_LOAD_REGISTER_MEM
		Format:	OpCode
22	Use Global GTT		
	Format:	Boolean	
This bit if set when executing from a non-privileged batch buffer will be treated as privilege access violation. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer or ring buffer. This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.			

MI_LOAD_REGISTER_MEM						
	21	Async Mode Enable If this bit is set then the command stream will not wait for completion of this command before executing the next command. Please refer to the LOAD_INDIRECT and Predicate registers for usage of this bit.

MI_LOAD_REGISTER_REG

MI_LOAD_REGISTER_REG			
Project:	BDW		
Source:	CommandStreamer		
Length Bias:	2		
<p>The MI_LOAD_REGISTER_REG command reads from a source register location and writes that value to a destination register location.</p> <p>Any offset that is to a destination outside of the GT core will allow the parser to continue once the cycle is at the GT boundry and not destination. Any other address will ensure the destination is updated prior to parsing the next command</p>			
Programming Notes			
The command temporarily halts commands that will cause cycles down the 3D pipeline.			
Destination register with mask implemented will not get updated unless the value read from source register has the bits corresponding to the mask bits set. Note that any mask implemented register when read returns "0" for the bits corresponding to mask location. When the source and destination are mask implemented registers, destination register will not get updated with the source register contents.			
This command is not allowed to update the privilege register range when executed from a non-privilege batch buffer.			
Writes to the range 0x9400-0x97FF must be either be avoided, or serialized with a read (e.g. STORE_REGISTER_MEM) between them.

MI_MATH

MI_MATH		
Project:	BDW	
Source:	RenderCS	
Length Bias:	2	
<p>The MI_MATH command allows SW to send instruction to ALU in Render Command Streamer. MI_MATH command is the means by which ALU can be accessed. ALU instructions form the data payload of MI_MATH command, ALU instruction is dword in size. MI_MATH Dword Length should be programmed based on the number of ALU instruction packed, max number is limited by the max Dword Length supported. When MI_MATH command is parsed by command streamer it outputs the payload dwords (ALU instructions) to the ALU. ALU takes single clock to process any given instruction. Refer to B-spec "Command Streamer (CS) ALU Programming" section in Command Streamer Programming.</p>

MI_NOOP

MI_NOOP			
Project:	BDW		
Source:	VideoEnhancementCS		
Length Bias:	1		
<p>The MI_NOOP command basically performs a "no operation" in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform - a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism.</p>

MI_RS_CONTEXT

MI_RS_CONTEXT			
Project:	BDW		
Source:	RenderCS		
Length Bias:	1		
The MI_RS_CONTEXT command is used to force a resource streamer context save or restore.			
Programming Notes			
This command must not be used/programmed in Execution List mode of scheduling.			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	MI Command Opcode	
		Default Value:	0Fh MI_RS_CONTEXT
		Format:	OpCode
	22:1	Reserved	
		Format:	MBZ
	0	Resource Streamer Save	
		Format:	U1
This bit specifies whether the MI_RS_CONTEXT command will cause the resource streamer context to be saved or restored.			
Value		Name	Description
0h		Restore	Resource Streamer context is restored
1h	Save	Resource Streamer context is saved	

MI_RS_CONTROL

MI_RS_CONTROL	
Project:	BDW
Source:	RenderCS
Length Bias:	1
The MI_RS_CONTROL command is used to start or stop the Resource Streamer.	
Programming Notes	
<ul style="list-style-type: none"> • This command must be programmed only inside a Resource Streamer enabled batch buffer. • This command provides means to selectively disable or enable Resource Streamer for set of commands in a Resource Streamer enabled batch buffer • On re-enabling the Resource Streamer through this command, command streamer will start Resource Streamer on the next non-sync command of the batch buffer. • This command status is render context save/restored during context switching. • The scope of MI_RS_CONTROL is within the batch buffer it is programmed, it doesn't get carried to the following chained batch buffer or second level batch buffer. RS control status goes back to default mode of Resource Streamer Enabled on all batch buffer arbitration boundaries. Batch buffer arbitration boundaries includes calling a chained or a second level batch buffer through MI_BATCH_BUFFER_START command or terminating a batch buffer through MI_BATCH_BUFFER_END command. • Example: <ol style="list-style-type: none"> 1. MI_BATCH_START (Primary batch buffer with RS enable) 2. Command 1 --> CS starts RS 3. Command 2 4. : 5. MI_RS_CONTROL (stop option) -> RS will stop on this command, CS sets RS control status to STOP. 6. Command 3 7. MI_BATCH_START (2nd level batch with RS enable not set, RS control status gets reset to default status of START) 8. : 9. MI_BATCH_END (Second Level Batch End) 10. Command 4 --> CS starts RS here as RS control flag gets reset to START at step-7 11. MI_BATCH_BUFFER_END 	
Workaround	

MI_RS_CONTROL

Due to known HW issue "Resource Streamer Control" status of MI_RS_CONTROL command is not context save/restored across context switches. SW must ensure all pool allocations (3DSTATE_BINDING_TABLE_POOL_ALLOC, 3DSTATE_GATHER_POOL_ALLOC, 3DSTATE_DX9_CONSTANT_BUFFER_POOL_ALLOC) are disabled and no Resource Streamer specific commands are programmed when the "Resource Streamer Control" is programmed to "Stop".

Example:

.....

MI_RS_CONTROL (Stop Resource Streamer)

```
3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Disable)
3DSTATE_GATHER_POOL_ALLOC (Gather Pool Disable),
3DSTATE_DX9_CONSTANT_BUFFER_POOL_ALLOC (Constant Buffer Pool Disable)
//Following Commands must not be programmed
//3DSTATE_BINDING_TABLE_EDIT_*
//3DSTATE_GATHER_CONSTANT_*
//3DSTATE_DX9_CONSTANTF_*
```

.....

MI_RS_CONTROL (Start Resource Streamer)

```
3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Enable)
3DSTATE_GATHER_POOL_ALLOC (Gather Pool Enable),
3DSTATE_DX9_CONSTANT_BUFFER_POOL_ALLOC (Constant Buffer Pool Enable)
```

.....

		Format:	U32
		This field specifies the DWord value to be written to the targeted location.	

MI_SEMAPHORE_SIGNAL

MI_SEMAPHORE_SIGNAL			
Project:	BDW		
Source:	CommandStreamer		
Length Bias:	2		
<p>This command is used to signal the target engine stating the memory semaphore update occurrence to one of its contexts with Target Context ID. MI_SEMAPHORE_SIGNAL and MI_SEMAPHORE_WAIT together replace the MI_SEMAPHORE_MBOX command on BDW. MI_ATOMIC (non-posted) command will be programmed prior to this command to update the semaphore data in memory.</p>			
Workaround			
<p>Workaround: Post-Sync operation bit must not be set when Target Engine Select is set to RCS.</p>			
DWord	Bit	Description	
0	31:29	Command Type	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	MI Command Opcode	
		Default Value:	1Bh MI_SEMAPHORE_SIGNAL
		Format:	OpCode
	22	Reserved	
		Format:	MBZ
	21	Post-Sync Operation	
		Project:	BDW
Source:		RenderCS	
Value		Name	Description
0h		No Post Sync Operation	Command is executed as usual.
1h	Post Sync Operation	MI_SEMAPHORE_SIGNAL command is executed as a pipelined PIPE_CONTROL flush command with Semaphore Signal as post sync operation. Flush completion only guarantees the workload prior to this command is pushed till Windower unit and completion of any outstanding flushes issued prior to this command.	

MI_SEMAPHORE_SIGNAL

	Programming Notes																
	<p>Any desired pipeline flush operation can be achieved by programming PIPE_CONTROL command prior to this command.</p> <p>When this bit is set Command Streamer sends a flush down the pipe and the atomic operation is saved as post sync operation. Command streamer goes on executing the following commands. Atomic operation saved as post sync operation is executed at some point later on completion of corresponding flush issued.</p> <p>When this bit is set atomic semaphore signal operation will be out of order with rest of the MI commands programmed in the ring buffer or batch buffer, it will be in order with respect to the post sync operations resulting due to PIPE_CONTROL command.</p>																
	Workaround																
	<p>Workaround: "Post Sync Operation" bit must not be set when MI_SEMAPHORE_SIGNAL command is programmed by GPGPU and MEDIA workloads (i.e when PIPELINE_SELECT command is set to GPGPU or MEDIA). This is to WA FFDOP CG issue, this WA need not be implemented when FF_DOP_CG is disabled via "Fixed Function DOP Clock Gate Disable" bit in RC_PSMI_CTRL register.</p> <p>Workaround: Post-Sync operation bit must not be set when Target Engine Select is set to RCS.</p>

Description					
<p>In execlist based scheduling this field contains the Context ID corresponding to the context of the target engine that this command is signaling. Target engine waiting on MI_SEMAPHORE_WAIT in signal mode will re-fetch the data from memory or comparison if its context ID is same as this signaled Context ID. When execlists are enabled, Target engine on receiving this Context ID sends message to the SHIM if it doesn't have the context with the same Context ID running. Message send to SHIM carries the Context ID which will be looked at by UC for rescheduling the signaled Context ID. Target engine waiting on MI_SEMAPHORE_WAIT in signal mode will fetch data from memory for comparison on receiving signal irrespective of the context id received.</p>					
<p>In ring buffer mode of scheduling this field doesn't have any relevance.</p>					

MI_SEMAPHORE_WAIT

MI_SEMAPHORE_WAIT	
Project:	BDW
Source:	CommandStreamer
Length Bias:	2
Description	
<p>This command supports memory based Semaphore WAIT. Memory based semaphores will be used for synchronization between the Producer and the Consumer contexts. Producer and Consumer Contexts could be running on different engines or on the same engine inside GT. Running on the same engine is only possible when execlists are enabled. Producer Context implements a Signal and Consumer context implements a Wait. Command Streamer on parsing this command fetches data from the Semaphore Address mentioned in this command and compares it with the inline Semaphore Data Dword.</p> <ul style="list-style-type: none"> • If comparison passes, the command streamer moves to the next command. • When execlists are enabled, if comparison fails Command streamer switches out the context. Context switch can be inhibited by setting "Inhibit Synchronous Context Switch" in CTXT_SR_CTL register. • In ring buffer mode of scheduling or Execlist with "Inhibit Synchronous context Switch", if comparison fails, Command Streamer evaluates the Compare Operation based on the Wait Mode until the compare operation is true or Wait is canceled by SW. • Exec-List Scheduling: CS generates semaphore wait interrupt to the scheduler when MI_SEMAPHORE_WAIT command is un-successful and when "Inhibit Synchronous Context Switch" is set. Scheduler can use this interrupt to preempt the context waiting on semaphore wait. • Ring Buffer Scheduling: CS generates semaphore wait interrupt to the scheduler when MI_SEMAPHORE_WAIT command is un-successful. <p>MI_SEMPHORE_SIGNAL and MI_SEMAPHORE_WAIT together replace the MI_SEMAPHORE_MBOX command on BDW.</p>	
Programming Notes	Source
<p>Render CS Only: SW must always program PIPE_CONTROL with "CS Stall" and "Render Target Cache Flush Enable" set prior to programming MI_SEMAPHORE_WAIT command for GPGPU workloads i.e when pipeline select is GPGPU via PIPELINE_SELECT command. This is required to achieve better GPGPU preemption latencies for certain programming sequences. If programming PIPE_CONTROL has performance implications then preemption latencies can be trade off against performance by not implementing this programming note.</p>	RenderCS
<p>Render CS Only: Ring Buffer Scheduling: CS doesn't generate semaphore wait interrupt to the scheduler when MI_SEMAPHORE_WAIT command is un-successful.</p>	RenderCS
<p>[Ring Buffer Mode Of scheduling] [BlitterCS, VideoCS, VideoEnhancementCS, VideoCS2: Command Streamers Only]: HW loses Page Directory (PPGTT) information on becoming IDLE. SW must always program the PD information following MI_SEMAPHORE_WAIT command. This will ensure Page Directory information gets reprogrammed after exiting IDLE flow triggered on MI_SEMAPHORE_WAIT command. Alternatively SW can disable IDLE flows on MI_SEMAPHORE_WAIT by setting "Semaphore Wait Event IDLE Message Disable" bit in "BCS_ECOSKPD" register.</p>	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS

MI_SEMAPHORE_WAIT

[VideoCS, VideoEnhancementCS, VideoCS2: Command Streamers Only]: MI_SEMAPHORE_WAIT cannot be executed in a batch buffer(MI_BATCH_BUFFER_START) while in Ring Buffer Mode (GFX_MODE bit 15).

VideoCS, VideoCS2, VideoEnhancementCS

Workaround

Workaround:

[All Command Streamers][Ring Buffer Mode of Scheduling]:

MI_SEMAPHORE_WAIT command must be always programmed with "Wait Mode" set to "Polling Mode" **Or** MI_SEMAPHORE_WAIT command with "Wait Mode" set to "Polling Mode" can be programmed when "Semaphore Wait Event IDLE message Disable" bit in "RC_PSMI_CTRL" register is set to disable Idle messaging on unsuccessful MI_SEMAPHORE_WAIT.

MI_SEMAPHORE_WAIT

MI_SEMAPHORE_WAIT

Project: BDW
 Source: VideoEnhancementCS
 Length Bias: 2

This command supports memory based Semaphore WAIT. Memory based semaphores will be used for synchronization between the Producer and the Consumer contexts. Producer and Consumer Contexts could be running on different engines or on the same engine inside GT, same engine only possible when execlists are enabled. Producer Context implements a Signal and Consumer context implements a Wait. Command Streamer on parsing this command fetches data from the Semaphore Address mentioned in this command and compares it with the inline Semaphore Data Dword.

- If comparison passes, the command streamer moves to the next command.
- When execlists are enabled, if comparison fails Command streamer switches out the context. Context switch can be inhibited by setting "Inhibit Synchronous Context Switch" in VECS_CTXT_SR_CTL register.
- In ring buffer mode of scheduling or execlist with "Inhibit Synchronous context Switch", if comparison fails, Command Streamer evaluates the Compare Operation based on the Wait Mode until the compare operation is true or Wait is canceled by SW.
- VECS always generates an interrupt to the scheduler on encountering semaphore failure.

MI_SEMPHORE_SIGNAL and MI_SEMAPHORE_WAIT together replace the MI_SEMAPHORE_MBOX command on BDW.

Programming Notes	Project
[Ring Buffer Mode Of scheduling][Video Enhancement CS]: HW loses Page Directory (PPGTT) information on becoming IDLE. SW must always program the PD information following MI_SEMAPHORE_WAIT command. This will ensure Page Directory information gets reprogrammed after exiting IDLE flow triggered on MI_SEMAPHORE_WAIT command. Alternatively SW can disable IDLE flows on MI_SEMAPHORE_WAIT by setting "Semaphore Wait Event IDLE Message Disable" bit in "VECS_ECOSKPD" register.	BDW

MI_SET_CONTEXT

MI_SET_CONTEXT			
Project:	BDW		
Source:	RenderCS		
Length Bias:	2		
<p>The MI_SET_CONTEXT command is used to specify the <i>logical</i> context associated with the hardware context. A logical context is an area in memory used to store hardware context information, and the context is referenced via a 2KB-aligned pointer. If the (new) logical context is different (i.e., at a different memory address), the device saves the current HW context values to the current logical context address, and then restores (loads) the new logical context by reading the context from the new address and loading it into the hardware context state. If the logical context address specified in this command matches the current logical context address, this command is effectively treated as a NOOP. Specific to the Render command stream only.</p> <p>This command also includes some controls over the context save/restore process.</p> <ul style="list-style-type: none"> • The Force Restore bit can be used to refresh the on-chip device state from the same memory address if the indirect state buffers have been modified. • The Restore Inhibit bit can be used to prevent the new context from being loaded at all. This must be used to prevent an uninitialized context from being loaded. Once software has initialized a context (by setting all state variables to initial values via commands), the context can then be stored and restored normally. • This command is legal only if Execlist Enable in the GFX_MODE register is reset. Otherwise, execlists must be used to switch context in lieu of MI_SET_CONTEXT. • This command needs to be always followed by a single MI_NOOP instruction to workaround a silicon issue. • When switching from a generic media context to a 3D context, the generic media state must be cleared via the Generic Media State Clear bit 16 in PIPE_CONTROL (or bit 4 in MI_FLUSH) before saving 3D context. • MI_SET_CONTEXT commands are permitted only within a ring buffer (not within a batch buffer). 			
Programming Notes			
<p>MI_ARB_ON_OFF with 'Arbitration Enable Reset' set should be programmed before an MI_SET_CONTEXT command. MI_ARB_ON_OFF with 'Arbitration Enable' set should be programmed after an MI_SET_CONTEXT command. This programming ensures that PSMI context switch flows do not conflict with MI_SET_CONTEXT flows.</p>

If set, the resource streamer state identified in the Logical Context Data section of the Memory Data Formats chapter is saved as part of switching away from this logical context. This bit will be stored in the associated CCID register to control the context save operation when switching away from this context (as part of a subsequent MI_SET_CONTEXT command).													

MI_SET_CONTEXT

2	<p>Resource Streamer State Restore Enable</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 60%;">Project:</td> <td>BDW</td> </tr> <tr> <td>Format:</td> <td>Enable</td> </tr> </table> <p>If set, the resource streamer state identified in the Logical Context Data section of the Memory Data Formats chapter is loaded (or restored) as part of switching to this logical context. This bit affects the switch (if required) to the context specified in Logical Context Address. This bit will also be stored in the associated CCID register to control a subsequent context save operation when switching to this context (as part of a subsequent ring buffer switch).</p>	Project:	BDW	Format:	Enable
Project:	BDW				
Format:	Enable				
1	<p>Force Restore</p> <p>When switching to this logical context a comparison between Logical Context Address and the contexts of the CCID register is performed. Normally, matching addresses prevent a context restore from occurring; however, when this bit is set a context restore is forced to occur. This bit cannot be set with Restore Inhibit. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.</p>				
0	<p>Restore Inhibit</p> <p>If set, the restore of the HW context from the logical context specified by Logical Context Address is inhibited (i.e., the existing HW context values are maintained). This bit must be used to prevent the loading of an uninitialized logical context. If clear, the context switch proceeds normally. This bit cannot be set with Force Restore. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.</p>				

MI_SET_PREDICATE

MI_SET_PREDICATE			
Project:	BDW		
Source:	RenderCS		
Length Bias:	1		
Description			
<p>This command sets the Predication Check for the subsequent commands in the command buffer except for MI_SET_PREDICATE itself. Render Command Streamer NOOPs the following commands based on the PREDICATE_ENABLE from MI_SET_PREDICATE, MI_SET_PREDICATE_RESULT and MI_SET_PREDICATE_RESULT_2 status. Resource Streamer doesn't take any action of parsing MI_SET_PREDICATE, this command is similar to any other command which is not meant for resource streamer.</p> <p>Executing MI_SET_PREDICATE command sets PREDICATE_ENABLE bits in MI_MODE register, MI_MODE register gets render context save restored.</p>			
Programming Notes			
<ul style="list-style-type: none"> MI_SET_PREDICATE predication scope must be confined within a Batch Buffer to set of commands. MI_SET_PREDICATE with Predicate Enable Must always have a corresponding MI_SET_PREDICATE with Predicate Disable within the same Batch Buffer. MI_ARB_CHK command must be programmed outside the Predication Scope of MI_SET_PREDICATE. MI_SET_PREDICATE Predication Scope must not involve any RC6 triggering events. 			
<p>Only the following command(s) can be programmed between the MI_SET_PREDICATE command enabled for predication: 3DSTATE_URB_VS 3DSTATE_URB_HS 3DSTATE_URB_DS 3DSTATE_URB_GS 3DSTATE_PUSH_CONSTANT_ALLOC_VS 3DSTATE_PUSH_CONSTANT_ALLOC_HS 3DSTATE_PUSH_CONSTANT_ALLOC_DS 3DSTATE_PUSH_CONSTANT_ALLOC_GS 3DSTATE_PUSH_CONSTANT_ALLOC_PS MI_LOAD_REGISTER_IMM MEDIA_VFE_STATE MEDIA_OBJECT MEDIA_OBJECT_WALKER MEDIA_INTERFACE_DESCRIPTOR_LOAD 3DSTATE_WM_HZ_OP</p>

MI_STORE_DATA_IMM

MI_STORE_DATA_IMM			
Project:	All		
Source:	RenderCS		
Length Bias:	2		
Description			
<p>The MI_STORE_DATA_IMM command requests a write of the QWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p> <p>This command supports writing to multiple consecutive dwords or qwords memory locations from the starting address.</p>			
Programming Notes			
<ul style="list-style-type: none"> This command should not be used within a "non-privilege" batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or privilege batch buffers to access global virtual space. This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers). This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete eventually, there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations. <p>Number of consecutive dwords or qwords programmed must be restricted such that the DWord Length doesn't exceed 0x3FE, i.e single command supports updating 1021 consecutive dword locations or 510 qword locations.</p>

		Format:	U32 FormatDesc
		This field specifies the upper DWord value to be written to the targeted QWord location (DW 1).	

MI_STORE_DATA_IMM

MI_STORE_DATA_IMM			
Project:	BDW		
Source:	VideoEnhancementCS		
Length Bias:	2		
<p>The MI_STORE_DATA_IMM command requests a write of the QWord or DWord constant supplied in the packet to the specified Memory Address. This command also supports writing to consecutive dword or qword memory locations from the starting address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p>			
Programming Notes			
<p>This command should not be used within a "non_privilege" batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or "privilege" batch buffers. If used within a non-privilege batch buffer, Use Global GTT must be clear. This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers). This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete "eventually", there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations.</p>

MI_STORE_DATA_IMM

MI_STORE_DATA_IMM										
Project:	BDW									
Source:	BlitterCS									
Length Bias:	2									
Description										
<p>The MI_STORE_DATA_IMM command requests a write of the QWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p> <p>This command supports writing to multiple consecutive dword or qword memory locations from the starting address.</p>										
Programming Notes										
<p>This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers). However, the cacheable nature of the transaction is determined by the setting of the "mapping type" in the GTT entry. This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete "eventually", there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations. All writes to memory generated using this command are expected to finish in order.</p> <p>This command should not be used within a "non_privilege" batch buffer to access global virtual space, doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation.</p>

MI_STORE_REGISTER_MEM

MI_STORE_REGISTER_MEM			
Project:	BDW		
Source:	CommandStreamer		
Length Bias:	2		
<p>The MI_STORE_REGISTER_MEM command requests a register read from a specified memory mapped register location in the device and store of that DWord to memory. The register address is specified along with the command to perform the read.</p>			
Programming Notes	Source		
<ul style="list-style-type: none"> The command temporarily halts command execution. The memory address for the write is snooped on the host bus. This command should not be used from within a "non-privilege" batch buffer to access global virtual space. doing so will be treated as privilege access violation. Refer "User Mode Privilege Command" in MI_BATCH_BUFFER_START command section to know HW behavior on encountering privilege access violation. This command can be used within ring buffers and/or "privilege" batch buffers to access global virtual space. This command will cause undefined data to be written to memory if given register addresses for the PGTBL_CTL_0 or FENCE registers. 			
<p>Source: BlitterCS, VideoCS, VideoEnhancementCS</p> <p>The source MMIO offset must be limited to any MMIO that is not replicated due to multiple slice configurations. If slice zero is disabled, then any MMIO read from this command streamer to a register replicated in the slice will cause a return value of zero.</p>	BlitterCS, VideoCS, VideoEnhancementCS

MI_WAIT_FOR_EVENT

MI_WAIT_FOR_EVENT		
Project:	BDW	
Source:	BlitterCS	
Length Bias:	1	
<p>The MI_WAIT_FOR_EVENT command is used to pause command stream processing until a specific event occurs or while a specific condition exists. Only one event/condition can be specified -- specifying multiple events is UNDEFINED. The effect of the wait operation depends on the source of the command. If executed from a batch buffer, the parser will halt (and suspend command arbitration) until the event/condition occurs. If executed from a ring buffer, further processing of that ring will be suspended, although command arbitration (from other rings) will continue. Note that if a specified condition does not exist (the condition code is inactive) at the time the parser executes this command, the parser proceeds, treating this command as a no-operation. If execution of this command from a primary ring buffer causes a wait to occur, the active ring buffer will effectively give up the remainder of its time slice (required in order to enable arbitration from other primary ring buffers).</p>		
Programming Notes		
<p>[Ring Buffer Mode Of scheduling Only][Blitter CS]: HW loses Page Directory (PPGTT) information on becoming IDLE. SW must always program the PD information following MI_WAIT_FOR_EVENT command. This will ensure Page Directory information gets reprogrammed on exiting IDLE flow triggered on MI_WAIT_FOR_EVENT. Alternatively SW can disable IDLE flows on MI_WAIT_FOR_EVENT by setting below bits in "BCS_ECOSKPD" register. Disable GT C6 Enter Due to Blitter Waiting on Vblank Disable GT C6 Enter Due to Blitter Waiting on Scanline Disable GT C6 Enter Due to Blitter Waiting on Flip Done</p>		
DWord	Bit	Description
0	31:29	Command Type Default Value: 0h MI_COMMAND
	28:23	MI Command Opcode Default Value: 03h MI_WAIT_FOR_EVENT
	22	Reserved Project: All Format: MBZ
	21	Display Pipe C Vertical Blank Wait Enable Project: BDW Format: Enable This field enables a wait until the next Display Pipe C "Vertical Blank" event occurs. This event is described as the start of the next Display C vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event in the Device Programming Interface chapter of MI Functions.
20	Display Sprite C Flip Pending Wait Enable Project: All Format: Enable This field enables a wait for the duration of a Display Sprite C "Flip Pending" condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers).	

MI_WAIT_FOR_EVENT

0	Display Pipe A Scan Line Wait Enable	
	Project:	BDW
	Format:	Enable
	<p>This field enables a wait while a Display Pipe A "Scan Line" condition exists. This condition is defined as the the start of the scan line specified in the Pipe A Display Scan Line Count Range Compare Register.</p>	

MI_WAIT_FOR_EVENT

MI_WAIT_FOR_EVENT						
Project:	BDW					
Source:	RenderCS					
Length Bias:	1					
Description						
<p>The MI_WAIT_FOR_EVENT command is used to pause command stream processing of this pipe only until a specific event occurs or while a specific condition exists. See Wait Events/Conditions, Device Programming Interface in <i>MI Functions</i>. Only one event/condition can be specified. Specifying multiple events is UNDEFINED. Once parsed, the parser will halt (and suspend command arbitration) until the event/condition occurs. Note that if a specified condition does not exist (the condition code is inactive) at the time the parser executes this command, the parser proceeds, treating this command as a no-operation.</p> <p>If CSunit is waiting for V-blank or flip done, HW can go into RC1/RC6 state.</p> <p>MI_NOOP setting NOP register (or any other benign command) must be set after MI_WAIT_FOR_EVENT under the following conditions:</p> <ul style="list-style-type: none"> • Back-to-back MI_WAIT_FOR_EVENT commands • MI_WAIT_FOR_EVENT is the last command before head = tail <p>Events must be unmasked in the Display Engine Render Response Mask Register (DE RRMR 0x44050) prior to waiting for them with a MI_WAIT_FOR_EVENT command, or in the case of flips or scanlines, prior to starting the flip or loading the scanline. Unmasked events will wake command streamer as they occur, so for improved power savings it is recommended to only unmask events that are required. Programming the DE RRMR register can be done through MMIO or a LOAD_REGISTER_IMMEDIATE command.</p> <p>Execution List Mode of Scheduling: CS on evaluating MI_WAIT_FOR_EVENT to be unsuccessful (has to wait for event to happen) triggers synchronous context switch stating the switch reason in Context Status Buffer. Note that synchronous context switch can be inhibited through programming "Inhibit Synchronous Context Switch" bit in CTXT_SR_CTL register or by disabling arbitration through MI_ARB_ON_OFF command.</p>						
Programming Notes		Source				
<p>Ring Buffer Mode of Scheduling Only: SW must always program a dummy MI_SEMAPHORE_WAIT command in Signal Mode which is always successful prior to programming MI_WAIT_FOR_EVENT.</p> <p>If the above programming restriction is not followed, in certain order of programming sequences HW would enter IDLE_DOP instead of IDLE_C6 on encountering MI_WAIT_FOR_EVENT unsuccessful.</p>		RenderCS				
<p>Render CS Only: SW must always program PIPE_CONTROL with "CS Stall" and "Render Target Cache Flush Enable" set prior to programming MI_WAIT_FOR_EVENT command for GPGPU workloads i.e when pipeline select is GPGPU via PIPELINE_SELECT command. This is required to achieve better GPGPU preemption latencies for certain programming sequences.</p> <p>If programming PIPE_CONTROL has performance implications then preemption latencies can be trade off against performance by not implementing this programming note.</p>		RenderCS

Move

mov - Move			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The mov instruction moves the components in src0 into the channels of dst. If src0 and dst are of different types, format conversion is performed. If src0 is a scalar immediate, the immediate value is loaded into enabled channels of dst. A mov with the same source and destination type, no source modifier, and no saturation is a raw move. A packed byte destination region (B or UB type with HorzStride == 1 and ExecSize > 1) can only be written using raw move.</p>			
<p>When denorm mode is flush to zero, a raw mov instruction with saturation modifier will not flush the denorm input or output to zero (Denorm is preserved).</p>			
<p>Format: [(pred)] mov[.cmod] (exec_size) dst src0</p>			
Programming Notes			
<p>A <i>mov</i> instruction with a source modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move).</p>			
<p>There is no direct conversion from B/UB to DF or DF to B/UB. Use two instructions and a word or DWord intermediate type.</p>			
<p>There is no direct conversion from B/UB to Q/UQ or Q/UQ to B/UB. Use two instructions and a word or DWord intermediate integer type.</p>			
<p>There is no direct conversion from HF to DF or DF to HF. Use two instructions and F (Float) as an intermediate type.</p>			
<p>There is no direct conversion from HF to Q/UQ or Q/UQ to HF. Use two instructions and F (Float) or a word integer type or a DWord integer type as an intermediate type.</p>			
Restriction			
<p>Raw move is not supported for Float values in ALT mode if any values are infinities or NaNs.</p>			
<p>An accumulator can be a source or destination operand but not both.</p>			
Syntax			
<p>[(pred)] mov[.cmod] (exec_size) reg reg [(pred)] mov[.cmod] (exec_size) reg imm32 [(pred)] mov[.cmod] (exec_size) reg imm64</p>			
Pseudocode			
<p>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n]; } }</p>

		Format:	EU_INSTRUCTION_HEADER

Move Indexed

movi - Move Indexed	
Project:	BDW
Source:	EuIsa
Length Bias:	4
<p>The movi instruction performs a fast component-wise indexed move for subfields from src0 to dst. The source operand must be an indirectly-addressed register. All channels of the source operand share the same register number, which is provided by the register field of the first address subregister, with a possible immediate register offset. The register fields of the subsequent address subregisters are ignored by hardware. The subregister number of a source channel is provided by the subregister field of the corresponding address subregister, with a possible immediate subregister offset.</p> <p>The destination register may be either a directly-addressed or an indirectly-addressed register.</p> <p>This instruction effectively performs a subfield shuffling from one register to another. Up to eight subfields can be selected by an instruction.</p>	
Format: [(pred)] movi (exec_size) dst src0 src1	
Programming Notes	
<p>HW Implementation Details:</p> <p>The source register is calculated by adding the register portion of the first index register with the register portion of the address immediate, $a0.0[11:5] + \text{addr_imm}[9:5]$</p> <p>For byte movi, byte0 of the destination is selected by $(a0.0[4:0])$, byte1 is selected by $(a0.1[4:0])$, ..., and byte7 is selected by $(a0.7[4:0])$. The rest of the bytes are undefined.</p> <p>For word movi, byte0 of the destination is selected by $(a0.0[4:1] \& 0)$, byte1 is selected by $(a0.0[4:1] \& 1)$, byte2 is selected by $(a0.1[4:1] \& 0)$, byte3 is selected by $(a0.1[4:1] \& 1)$, ..., and byte15 is selected by $(a0.7[4:1] \& 1)$. The rest of the bytes are undefined.</p> <p>For DWord or float movi, byte0 of the destination is selected by $(a0.0[4:2] \& 00b)$, byte1 is selected by $(a0.0[4:2] \& 01b)$, byte2 is selected by $(a0.0[4:2] \& 10b)$, byte3 is selected by $(a0.0[4:2] \& 11b)$, byte4 is selected by $(a0.1[4:2] \& 00b)$, byte5 is selected by $(a0.1[4:2] \& 01b)$, ..., byte31 is selected by $(a0.7[4:2] \& 11b)$.</p> <p>For all 3 conditions above, $a0.n[4:0] = a0.n[4:0] + \text{addr_imm}[4:0]$.</p>	
Restriction	
Source operand cannot be accumulators. The source operand must be a general register.	
The source and destination must have the same type.	
The execution size must be 8.	
The address register for the source must be aligned to the base (a0.0).	
The destination register (directly or indirectly addressed) must be 16-byte aligned.	
The destination region (directly or indirectly addressed) must point to the same GRF register.	
The destination stride in bytes must equal the source element size in bytes.	
The Align16 access mode is not allowed.	
All the index registers (address subregisters) used must point to the same GRF register.	
The instruction must use 1x1 indirect regioning.	
The destination offset is only used to create channel enables. Each element of the destination is directly mapped to the index registers for the movi instruction. i.e. a0.0 -> dst.0, a0.1 -> dst.1, a0.2 -> dst.2, etc.	

movi - Move Indexed

Only 8 address subregisters are used (a0.0-a0.7). Destination element 8 will be sourced from address register zero (a0.0), dst.9 <-a0.1, etc. This is an exception to the above restriction, for example:
 movi (8) r31.8:uw r[a0.0,0]<8;8,1>:uw // r31.8:uw<-a0.0:uw, r31.9:uw<-a0.1:uw, etc.

Conditional Modifier is not allowed for this instruction.

Syntax

[(pred)] movi (exec_size) reg reg imm

Pseudocode

```
Evaluate(WrEn); srcregfile = regfile(src0); srcregbase = reg(address[0]) + reg(addr_imm); for ( n = 0; n <
RegWidth; n++ ) { if ( WrEn.chan[n] ) { srcsubreg = subreg(address[n] + addr_imm); dst.chan[n] =
srcregfile.srcreg.srcsubreg; } }
```

Multiply

mul - Multiply			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The mul instruction performs component-wise multiplication of src0 and src1 and stores the results in dst. When multiplying integer datatypes, if src0 is DW and src1 is W, irrespective of the destination datatype, the accumulator maintains full 48-bit precision. This is required to handle the macro for 32x32 multiplication. The macro described in the mach instruction should be used to obtain the full precision 64-bit multiplication results. Note: A 32x32 multiply operation is handled natively, without a macro. When operating in this mode, the resulting 64-bit data is packed, unlike the macro, where the lower and upper 32 bits of the result are written to different general registers by two separate instructions. Refer to the macro description for details. When multiplying integer data types, if one of the sources is a DW, the resulting full precision data is stored in the accumulator. However, if the destination data type is either W or DW, the low bits of the result are written to the destination register and the remaining high bits are discarded. This results in undefined Overflow and Sign flags. Therefore, conditional modifiers and saturation (.sat) cannot be used in this case.</p>			
Format: [(pred)] mul[.cmod] (exec_size) dst src0 src1			
Restriction			
Integer source operands cannot be accumulators.			
When multiplying a DW and any lower precision integer, the DW operand must on src0.			
When multiplying DW x DW, the dst cannot be accumulator.			
Syntax			
[(pred)] mul[.cmod] (exec_size) reg reg reg [(pred)] mul[.cmod] (exec_size) reg reg imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n] * src1.chan[n]; } }

Multiply Accumulate High

mach - Multiply Accumulate High			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The mach instruction performs DWord integer multiply-accumulate operation and outputs the high DWord (bits 63:32). For each enabled channel, this instruction multiplies the DWord in src0 with the high word of the DWord in src1, left shifts the result by 16 bits, adds it with the corresponding accumulator values, and keeps the whole 64-bit result in the accumulator. It then stores the high DWord (bits 63:32) of the results in dst. This instruction is intended to be used to emulate 32-bit DWord integer multiplication by using the large number of bits available in the accumulator. For example, the following instructions perform vector multiplication of two 32-bit signed integer sources from r2 and r3 and store the resulting vectors with the high 32 bits in r5 and the low 32 bits in r6. <code>mul (8) acc0:d r2.0<8;8,1>:d r3.0<16;8,2>:uw mach (8) r5.0<1>:d r2.0<8;8,1>:d r3.0<8;8,1>:d mov (8) r6.0<1>:d acc0:d // Low 32 bits.</code> Here is a different example including negation. An added preliminary <code>mov</code> is required for source modification on src1. <code>mov (8) r3.0<1>:d -r3<8;8,1>:d mul (8) acc0:d r2.0<8;8,1>:d r3.0<16;8,2>:uw mach (8) r5.0<1>:d r2.0<8;8,1>:d r3.0<8;8,1>:d // High 32 bits mov (8) r6.0<1>:d acc0:d // Low 32 bits.</code> The mach should have channel enable from the destHI of IMUL, the mov should have the channel enable from the destLO of IMUL. As mach is used to generate part of the 64-bit DWord integer results, saturation modifier should not be used. In fact, saturation modifier should not be used for any of these four instructions. Source and destination operands must be DWord integers. Source and destination must be of the same type, signed integer or unsigned integer. If dst is UD, src0 and src1 may be UD and/or D. However, if any of src0 and src1 is D, source modifier (abs) must be present to convert it to match with dst. If dst is D, src0 and src1 must also be D. They cannot be UD as it may cause unexpected overflow because the computed results are limited to 64 bits.</p>			
Format: <code>[(pred)] mach[.cmod] (exec_size) dst src0 src1</code>			
Restriction			
Accumulator is an implicit source and thus cannot be an explicit source operand.			
AccWrEn is required.			
Syntax			
<code>[(pred)] mach[.cmod] (exec_size) reg reg reg [(pred)] mach[.cmod] (exec_size) reg reg imm32</code>			
Pseudocode			
<pre>Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { acc.chan[n][63:0] = (src1.chan[n][31:16] * src0.chan[n][31:0]) << 16 + acc.chan[n][63:0]; dst.chan[n][31:0] = acc.chan[n][63:32]; } }</pre>			
Description			
A source modifier must not be used on src1 for the macro operation. This applies to both mul and mach of the macro. If source modifier is required, an additional mov instruction may be used before the macro.

Multiply Add for Macro

madm - Multiply Add for Macro			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The madm instruction takes component-wise multiplication of src1 and src2, adds the results with the corresponding src0 values, and then stores the final results in dst. The source and destination operands have a higher precision carried in the exponent for this operation. The madm instruction is used for macro operations, where precision is accumulated over several instructions. This accumulation requires the exponent to increase by 2 extra bits across multiple madm operations. Refer to Macros Defined in 'Math' Section for usage and restrictions of this operation.</p>			
Format: [(pred)] madm[.cmod] (exec_size) dst src0 src1 src2			
Restriction			
Accumulator access is restricted to the special accumulators (acc2-acc9). Refer to the Accumulator Section for details on the special accumulators.			
Syntax			
[(pred)] madm[.cmod] (exec_size) reg reg reg reg			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n++) { if (WrEn.chan[n]) { dst.chan[n] = src1.chan[n] * src2.chan[n] + src0.chan[n]; } }

PIPE_CONTROL			
25	Reserved		
	Project:	All	
	Format:	MBZ	
24	Destination Address Type		
	Project:	BDW	
	Defines address space of Destination Address		
	Value	Name	Description
	0h	PPGTT	Use PPGTT address space for DW write
	1h	GGTT	Use GGTT address space for DW write
	Programming Notes		
Ignored if ""No Write" is selected in Operation.			
23	LRI Post Sync Operation		
	Project:	BDW	
	Value	Name	Description
	0h	No LRI Operation	No LRI operation occurs as a result of this instruction. The Post-Sync Operation field is valid and may be used to specify an operation.
	1h	MMIO Write Immediate Data	Write the DWord contained in Immediate Data Low (DW3) to the MMIO offset specified in the Address field.
	Programming Notes		
	This bit causes a post sync operation with an LRI (Load Register Immediate) operation. If this bit is set then the Post-Sync Operation field must be cleared.		
22	Reserved		
	Project:	All	
21	Store Data Index		
	Project:	BDW	
	Format:	U1	
	Ring Buffer Mode Scheduling: This field is valid only if the post-sync operation is not 0. If this bit is set, the store data address is actually an index into the global hardware status page. This bit only applies to the Global HW status page. If this field is 1, the Destination Address Type in this command must be set to 1 (GGTT). Execlist Mode Scheduling: This field is valid only if the post-sync operation is not 0. If this bit is set, the store data address is index into the global hardware status page when destination address type in the command is set to 1 (GGTT). The store data address is index into the per-process hardware status page when destination address type in the command is set to 0 (PPGTT).		

PIPE_CONTROL		
20	Command Streamer Stall Enable	
	Project:	All
	Format:	U1
<p>If ENABLED, the sync operation will not occur until all previous flush operations pending a completion of those previous flushes will complete, including the flush produced from this command. This enables the command to act similar to the legacy MI_FLUSH command.</p>		
Programming Notes		
<p>One of the following must also be set:</p> <ul style="list-style-type: none"> • Render Target Cache Flush Enable ([12] of DW1) • Depth Cache Flush Enable ([0] of DW1) • Stall at Pixel Scoreboard ([1] of DW1) • Depth Stall ([13] of DW1) • Post-Sync Operation ([13] of DW1) • DC Flush Enable([5] of DW1) 		
<p>This bit must be always set when PIPE_CONTROL command is programmed by GPGPU and MEDIA workloads, except for the cases when only Read Only Cache Invalidation bits are set (State Cache Invalidation Enable, Instruction cache Invalidation Enable, Texture Cache Invalidation Enable, Constant Cache Invalidation Enable). This is to WA FFDOP CG issue, this WA need not implemented when FF_DOP_CG is disable via "Fixed Function DOP Clock Gate Disable" bit in RC_PSMI_CTRL register.</p>		
19	Global Snapshot Count Reset	
	Project:	All
	Format:	U1
	Value	Name Description
	0h	Don't Reset Do not reset the snapshot counts or Statistics Counters.
	1h	Reset Reset the snapshot count in Gen4 for all the units and reset the Statistics Counters except as noted above.
Programming Notes		
<p>TIMESTAMP is not reset by PIPE_CONTROL with this bit set. When Post Sync Operation is set to "Write PS Depth Count" along with Global Snapshot Count Reset, PS Depth Count is Reported first before resetting the value.</p>		

PIPE_CONTROL					
18	TLB Invalidate <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 70%;">Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U1</td> </tr> </table> <p>If ENABLED, all TLBs belonging to Render Engine will be invalidated once the flush operation is complete. Note that if the flush TLB invalidation mode is clear, a TLB invalidate will occur irrespective of this bit setting</p> <p>If ENABLED, PIPE_CONTROL command will flush the in flight data written out by render engine to Global Observation point on flush done. Also Requires stall bit ([20] of DW1) set.</p> <div style="text-align: center; background-color: #e6f2ff; padding: 5px;">Programming Notes</div> <p>If ENABLED, all TLBs belonging to Render Engine will be invalidated once the flush operation is complete. Note that if the flush TLB invalidation mode is clear, a TLB invalidate will occur irrespective of this bit setting.</p>	Project:	All	Format:	U1
	Project:	All

16	Generic Media State Clear <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 70%;">Project:</td> <td>BDW</td> </tr> <tr> <td>Format:</td> <td>Disable</td> </tr> </table> <p>If set, all generic media state context information will be invalidated. Any state invalidated will not be saved as part of the render engine context image. The state only only become valid once it is parsed by the command streamer.</p>	Project:	BDW	Format:	Disable
	Project:	BDW			
	Format:	Disable			

PIPE_CONTROL			
15:14	Post Sync Operation		
	Project:	All	
	Description		
	This field specifies an optional action to be taken upon completion of the synchronization operation.		
	This field must be cleared if the LRI Post-Sync Operation bit is set.		
	Value	Name	Description
	0h	No Write	No write occurs as a result of this instruction. This can be used to implement a "trap" operation, etc.
	1h	Write Immediate Data	Write the QWord containing Immediate Data Low, High DWs to the Destination Address
	2h	Write PS Depth Count	Write the 64-bit PS_DEPTH_COUNT register to the Destination Address
	3h	Write Timestamp	Write the 64-bit TIMESTAMP register to the Destination Address
Programming Notes			
If executed in non-secure batch buffer, the address given will be in a PPGTT address space. If in a secure ring or batch, address given will be in GGTT space			
13	Depth Stall Enable		
	Project:	All	
	Format:	Enable	
	This bit must be set when obtaining a "visible pixel" count to preclude the possible inclusion in the PS_DEPTH_COUNT value written to memory of some fraction of pixels from objects initiated after the PIPE_CONTROL command.		
	Value	Name	Description
	0h	Disable	3D pipeline will not stall subsequent primitives at the Depth Test stage.
	1h	Enable	3D pipeline will stall any subsequent primitives at the Depth Test stage until the Sync and Post-Sync operations complete.
	Programming Notes		
	This bit must be DISABLED for operations other than writing PS_DEPTH_COUNT.		
	This bit will have no effect (besides preventing write cache flush) if set in a PIPE_CONTROL command issued to the Media pipe.		

PIPE_CONTROL																	
12	<p>Render Target Cache Flush Enable</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 60%;">Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>Enable</td> </tr> </table> <p>Setting this bit will force Render Cache to be flushed to memory prior to this synchronization point completing. PIPE_CONTROL			
1	Stall At Pixel Scoreboard		
	Project:	All	
	Format:	Enable	
Defines the behavior of PIPE_CONTROL command at the pixel scoreboard.			
	Value	Name	Description
	0h	Disable	Stall at the pixel scoreboard is disabled.
	1h	Enable	Stall at the pixel scoreboard is enabled.
	Project		
			All
			All
Programming Notes			
This bit must be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries. This bit is ignored if Depth Stall Enable is set. Further the render cache is not flushed even if Write Cache Flush Enable bit is set.			
0	Depth Cache Flush Enable		
	Project:	All	
	Format:	Enable	
Setting this bit enables flushing (i.e. writing back the dirty lines to memory and invalidating the tags) of depth related caches. This bit applies to HiZ cache, Stencil cache and depth cache.			
	Value	Name	Description
	0h	Flush Disabled	Depth relates caches (HiZ, Stencil and Depth) are NOT flushed.
	1h	Flush Enabled	Depth relates caches (HiZ, Stencil and Depth) are flushed.
Programming Notes			
Ideally depth caches need to be flushed only when depth is required to be coherent in memory for later use as a texture, source or honoring CPU lock. This bit must be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries.			
2	31:2	Address	
		Project:	BDW
		Format:	GraphicsAddress[31:2]U32
If Post Sync Operation is set to 1h LRI Post-Sync Operation must be clear): Bits 31:3 specify the QW address of where the Immediate Data following this DW in the packet to be stored. Bit 2 MBZ Ignored if "No Write" is the selected in Post-Sync Operation If LRI Post-Sync Operation is set: Bits 22:2 (Bits 31:23 are reserved MBZ) specify the MMIO offset destination for the data in the Immediate Data Low (DW3) field. Only DW writes are valid.

PIPELINE_SELECT

PIPELINE_SELECT	
Project:	BDW
Source:	PRM
Length Bias:	1
Description	
The PIPELINE_SELECT command is used to specify which GPE pipeline is to be considered the 'current' active pipeline. Issuing 3D-pipeline-specific commands when the Media pipeline is selected, or vice versa, is UNDEFINED.	
Issuing 3D-pipeline-specific commands when the GPGPU pipeline is selected, or vice versa, is UNDEFINED.	
Programming common non pipeline commands (e.g., STATE_BASE_ADDRESS) is allowed in all pipeline modes.	
Programming Notes	
Software must ensure all the write caches are flushed through a stalling PIPE_CONTROL command followed by another PIPE_CONTROL command to invalidate read only caches prior to programming MI_PIPELINE_SELECT command to change the Pipeline Select Mode. Example: ... Workload-3Dmode PIPE_CONTROL (CS Stall, Depth Cache Flush Enable, Render Target Cache Flush Enable, DC Flush Enable) PIPE_CONTROL (Constant Cache Invalidate, Texture Cache Invalidate, Instruction Cache Invalidate, State Cache invalidate) PIPELINE_SELECT (GPGPU)	
Software must clear the COLOR_CALC_STATE Valid field in 3DSTATE_CC_STATE_POINTERS command prior to send a PIPELINE_SELECT with Pipeline Select set to GPGPU.	
Render CS Only: SW must always program PIPE_CONTROL with CS Stall and Render Target Cache Flush Enable set prior to programming PIPELINE_SELECT command for GPGPU workloads i.e when pipeline mode is set to GPGPU. This is required to achieve better GPGPU preemption latencies for certain programming sequences. If programming PIPE_CONTROL has performance implications then preemption latencies can be trade off against performance by not implementing this programming note.	
Hardware Binding Tables are only supported for 3D workloads. Resource streamer must be enabled only for 3D workloads. Resource streamer must be disabled for Media and GPGPU workloads. Batch buffer containing both 3D and GPGPU workloads must take care of disabling and enabling Resource Streamer appropriately while changing the PIPELINE_SELECT mode from 3D to GPGPU and vice versa. Resource streamer must be disabled using MI_RS_CONTROL command and Hardware Binding Tables must be disabled by programming 3DSTATE_BINDING_TABLE_POOL_ALLOC with "Binding Table Pool Enable" set to disable (i.e. value '0'). Example below shows disabling and enabling of resource streamer in a batch buffer for 3D and GPGPU workloads. MI_BATCH_BUFFER_START (Resource Streamer Enabled) PIPELINE_SELECT (3D) 3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Enabled) 3D WORKLOAD MI_RS_CONTROL (Disable Resource Streamer) 3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Disabled) PIPELINE_SELECT (GPGPU) GPGPU Workload 3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Enabled) MI_RS_CONTROL (Enable Resource Streamer) 3D WORKLOAD MI_BATCH_BUFFER_END

Plane

pln - Plane			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The pln instruction computes a component-wise plane equation ($w = p*u+q*v+r$ where $u/v/w$ are vectors and $p/q/r$ are scalars) of src0 and src1 and stores the results in dst. src1 is the input vector u. src0 provides input scalars p, q, and r, where p is the scalar value based on the region description of src0 and q and r are the scalar values implied from the src0 region. Specifically, q is the second component and r is the fourth component of the 4-tuple (128-bit aligned) that p belongs to.</p>			
Format: [(pred)] pln[.cmod] (exec_size) dst src0 src1			
Restriction			
This is a specialized instruction that only supports an execution size (ExecSize) of 8 or 16.			
The src0 region must be a replicated scalar (with HorzStride == VertStride == 0).			
src0 must specify .0 or .4 as the subregister number, corresponding to a subregister byte offset of 0 or 16.			
Source operands cannot be accumulators.			
Syntax			
[(pred)] pln[.cmod] (exec_size) reg reg reg			
Pseudocode			
<pre> Evaluate(WrEn); for (n = 0; n < exec_size; n++) { float dwP = src0.RegNum.SubRegNum[bits4:2]; // A DWord-aligned scalar. float dwQ = src0.RegNum.(SubRegNum[bit4:2] 0x1); // Second component. float dwR = src0.RegNum.(SubRegNum[bit4:2] 0x3); // Fourth component. if (ExecSize == 8) { u = src1.RegNum v = src1.(RegNum + 1) } else { if (n < 8) { u = src1.RegNum v = src1.(RegNum + 1) } else { u = src1.(RegNum + 2) v = src1.(RegNum + 3) } } if (WrEn.chan[n]) { dst.chan[n] = dwP * u.chan[n] + dwQ * v.chan[n] + dwR; } } </pre>

7:0	Binding Table Index	
	Project:	All
	Format:	MDC_BTS
Specifies the Binding Table Index for the message		

Return

ret - Return			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
Return execution to the code sequence that called a subroutine. The ret instruction can be predicated or non-predicated. If non-predicated, all channels jump to the return IP in the first channel of src0 and restore CallMask from the second channel of src0. If predicated, the enabled channels jump to the return IP from the first channel of src0 and the corresponding bits in the CallMask are cleared to zero; if all CallMask bits are zero after the ret instruction, then execution jumps to the return IP from the first channel of src0. When SPF is on, the predication control must be scalar.			
Format: [(pred)] ret (exec_size) null src0			
Restriction			
This instruction cannot take accumulator as source.			
The src0 regioning control must be <2;2,1>.

Scattered Move

smov - Scattered Move			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The smov instruction moves the components in src0 into dst. For each enabled channel, copy src0 to dst. The immediate is used to selectively enable channels without using flags. When predication is enabled, the predicate mask is not generated from the flags. Instead, the immediate is used to mask the execution mask. If any channel is enabled as a result of this masking, the instruction is executed. When predication is not enabled, the immediate masks the execution mask. This provides flexibility to mask out any channel with an immediate.</p>			
Format: [(pred)] smov[.cmod] (exec_size) dst src0 src1			
Programming Notes			
When predication is disabled, the immediate provides the flexibility to perform a select operation without the use of flags.			
When predication is enabled, the usage model provides flexibility to select any bit in the flag registers for predication for execution size of 1.			
Syntax			
[(pred)] smov[.cmod] (exec_size) reg reg imm32			
Pseudocode			
if pred emask = OR (emask AND imm32) Else pmask = imm32. Evaluate(WrEn); for (n = 0; n < 32; n++) { if (WrEn.chan[n]) { dst.chan[n] = src0.chan[n]; } }

Select

sel - Select			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The sel instruction selectively moves the components in src0 or src1 into the channels of dst based on the predication. On a channel by channel basis, if the channel condition is true, data in src0 is moved into dst. Otherwise, data in src1 is moved into dst.</p> <p>As the predication is used to select the two sources, it is not included in the evaluation of WrEn. The predicate clause is mandatory if cmod is omitted/0000b. If both predication and the conditional modifier are omitted, the results are undefined.</p> <p>If the conditional modifier is specified (not 0000b, a compare is performed and the resulting condition flag is used for the sel instruction. Conditional modifiers .ge and .l follow the cmpn rules, and all other conditional modifiers follow the cmp rules. Predication is not allowed in this mode.</p> <p>A sel instruction with cmod .l is used to emulate a MIN instruction.</p> <p>A sel instruction with cmod .ge is used to emulate a MAX instruction.</p> <p>For a sel instruction with a .l or .ge conditional modifier, if one source is NaN and the other not NaN, the non-NaN source is the result. If both sources are NaNs, the result is NaN. For all other conditional modifiers, if either source is NaN then src1 is selected.</p> <p>A sel instruction without a conditional modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move). This applies even if the source modifies are set on the sel instruction sources.</p> <p>The sel instruction uses any conditional modifier internally and does not update the flag register if a conditional modifier is used.</p> <p>A sel instruction with cmod or source modifier will flush denorm to zero, depending on the denorm mode bit; a sel instruction without cmod and source modifier will retain denorm.</p> <p>Format: (pred) sel[.cmod] (exec_size) dst src0 src1</p>			
Syntax

Send Message

send - Send Message	
Project:	BDW
Source:	EuIsa
Length Bias:	4
Description	
Send a message stored in GRF starting at <src> to a shared function identified by <ex_desc> along with control from <desc> with a GRF writeback location at <dest>.	
<p>The send instruction performs data communication between a thread and external function units, including shared functions (Sampler, Data Port Read, Data Port Write, URB, and Message Gateway) and some fixed functions (e.g. Thread Spawner, who also have an unique Shared Function ID). The send instruction adds an entry to the EU's message request queue. The request message is stored in a block of contiguous GRF registers. The response message, if present, will be returned to a block of contiguous GRF registers. The return GRF writes may be in any order depending on the external function units. <src> is the lead GRF register for request. <dest> is the lead GRF register for response. The message descriptor field <desc> contains the Message Length (the number of consecutive GRF registers) and the Response Length (the number of consecutive GRF registers). It also contains the header present bit, and the function control signals. The extend message descriptor field <ex_desc> contains the target function ID. WrEn is forwarded to the target function in the message sideband.</p>	
<p>The send instruction is the only way to terminate a thread. When the EOT (End of Thread) bit of <ex_desc> is set, it indicates the end of thread to the EU, the Thread Dispatcher and, in most cases, the parent fixed function. Message descriptor field <desc> can be a 32-bit immediate, imm32, or a 32-bit scalar register, <reg32a>. GEN restricts that the 32-bit scalar register <reg32a> must be the leading dword of the address register. It should be in the form of a0.0<0;1,0>:ud. When <desc> is a register operand, only the lower 29 bits of <reg32a> are used.</p>	
<p><ex_desc> is a 6-bit immediate, imm6. The lower 4bits of the <ex_desc> specifies the SFID for the message. The MSb of the message descriptor, the EOT field, always comes from bit 127 of the instruction word, which is the MSb of imm6. A thread must terminate with a send instruction with EOT turned on.</p>	
<p><src> is a 256-bit aligned GRF register. It serves as the leading GRF register of the request.</p>	

send - Send Message

<dest> serves for two purposes: to provide the leading GRF register location for the response message if present, and to provide parameters to form the channel enable sideband signals. <dest> signals whether there is a response to the message request. It can be either a null register, a direct-addressed GRF register or a register-indirect GRF register. Otherwise, hardware behavior is undefined. If <dest> is null, there is no response to the request. Meanwhile, the Response Length field in <desc> must be 0. Certain types of message requests, such as memory write (store) through the Data Port, do not want response data from the function unit. If so, the posted destination operand can be null. If <dest> is a GRF register, the register number is forwarded to the shared function. In this case, the target function unit must send one or more response message phases back to the requesting thread. The number of response message phases must match the Response Length field in <desc>, which of course cannot be zero. For some cases, it could be an empty return message. An empty return message is defined as a single phase message with all channel enables turned off. The subregister number, horizontal stride, destination mask and type fields of <dest> are always valid and are used in part to generate on the WrEn. This is true even if <dest> is a null register (this is an exception for null as for most cases these fields are ignored by hardware). The 16-bit channel enables of the message sideband are formed based on the WrEn. Interpretation of the channel enable sideband signals is subject to the target external function. In general for a 'send' instruction with return messages, they are used as the destination dword write mask for the GRF registers starting at <dest>. For a message that has multiple return phases, the same set of channel enable signals applies to all the return phases. Thread managed memory coherency: A special usage of using non-null <dest> is to support write-commit signaling for memory write service by the Data Port Write unit. If <post_dest> is not null for a memory write request, the Data Port along with the Data Cache or Render Cache will wait until all the posted writes for the request have reached the coherent domain before sending back to the requesting thread an empty message to <dest> register. A memory write reaching the coherent domain, also referred to as reaching the global observable state, means that subsequent read to the same memory location, no matter which thread issues the read, must return the data of the write. The destination dependency control, {NoDDClr}, can be used in this instruction. This allows software to control the destination dependencies for multiple 'read'-type messages similar to that for multiple instructions using EU execution pipeline. As send does not check register dependencies for the post destination, {NoDDChk} should not be used for this instruction.

Restriction

Software must obey the following rules in signaling the end of thread using the send instruction: The posted destination operand must be null. No acknowledgement is allowed for the send instruction that signifies the end of thread. This is to avoid deadlock as the EU is expecting to free up the terminated thread's resource. A thread must terminate with a send instruction with message to a shared function on the output message bus; therefore, it cannot terminate with a send instruction with message to the following shared functions: Sampler unit, NULL function. For example, a thread may terminate with a URB write message or a render cache write message. A root thread originated from the media (generic) pipeline must terminate with a send instruction with message to the Thread Spawner unit. A child thread should also terminate with a send to TS. Please refer to the Media Chapter for more detailed description. The send instruction cannot update accumulator registers. Saturate is not supported for send instruction. ThreadCtrl are not supported for send instruction. The send with EOT should use register space R112-R127 for <src>. This is to enable loading of a new thread into the same slot while the message with EOT for current thread is pending dispatch. Any instruction updating the ARF followed by the send not using predication must use a {Switch}. DepCtrl Must not be used with Send Instruction. When pagefault is enabled, the source and destination operands must not overlap. This is required to ensure the messages can be replayed.

		Project:	All
		Format:	MEMORY_OBJECT_CONTROL_STATE
		Specifies the memory object control state for indirect state using the Surface State Base Address .	
	3:1	Reserved	
		Project:	All
		Format:	MBZ
	0	Surface State Base Address Modify Enable	
		Project:	All
		Format:	Enable
		The other fields in this DWord and the following DWord are updated only when this bit is set.	
		Value	Name
		Description	
		0h	Disable
		1h	Enable
		Modify the address.	
		Programming Notes	
		Setting this bit to 1 in a batch buffer causes the resource streamer to stop; for performance reasons the SW should only place commands with this bit set in the ring buffer.	
		Before programming the Surface State Base Address, the RS must be disabled. Within a batch buffer where the RS is enabled, RS may be disabled thru a MI_RS_CONTROL command with Resource Streamer Control cleared prior to the STATE_BASE_ADDRESS with Surface State Base Address Modify Enable set and then re-enabled with another MI_RS_CONTROL with Resource Streamer Control set.

STATE_PREFETCH

STATE_PREFETCH								
Project:	BDW							
Source:	PRM							
Length Bias:	2							
<p>(This command is provided strictly for performance optimization opportunities, and likely requires some experimentation to evaluate the overall impact of additional prefetching.)</p> <p>The STATE_PREFETCH command causes the GPE to attempt to prefetch a sequence of 64-byte cache lines into the GPE-internal cache ("L2 ISC") used to access EU kernel instructions and fixed/shared function indirect state data. While state descriptors, surface state, and sampler state are automatically prefetched by the GPE, this command may be used to prefetch data not automatically prefetched, such as: 3D viewport state; Media pipeline Interface Descriptors; EU kernel instructions.</p>								
Restriction								
Restriction BDW bug# 1910068 : Due to know HW issue this command doesn't achieve its intended purpose and must not be exercised/programmed by SW.

1..2	63:4	System Instruction Pointer Project: All Format: InstructionBaseOffset[63:4]Kernel Specifies the instruction address of the system routine associated with the current context as a 128-bit granular offset from the Instruction Base Address. SIP is shared by all threads in execution. The address specifies the double quadword aligned instruction location. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47].	
		<p style="text-align: center;">Programming Notes</p> This portion of the command is not context save/restored. The context image may restore this command as a 2 dword command rather than a 3 dword command.	
	3:0	Reserved	
		Project:	All
		Format:	MBZ

Sum of Absolute Difference 2

sad2 - Sum of Absolute Difference 2			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The sad2 instruction takes source data channels from src0 and src1 in groups of 2-tuples. For each 2-tuple, it computes the sum-of-absolute-difference (SAD) between src0 and src1 and stores the scalar result in the first channel of the 2-tuple in dst. The results are also stored in the accumulator register. The destination operand and the accumulator maintain 16 bits per channel precision. The destination register must be aligned to even word (DWord). The even words in the destination region will contain the correct data. The odd words are also written but with undefined values.</p>			
Format: [(pred)] sad2[.cmod] (exec_size) dst src0 src1			
Restriction			
Source operands cannot be accumulators.			
The execution size cannot be 1 as the computation requires at least two data channels.			
Syntax			
[(pred)] sad2[.cmod] (exec_size) reg reg reg [(pred)] sad2[.cmod] (exec_size) reg reg imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < exec_size; n += 2) { if (WrEn.chan[n]) { dst.chan[n] = abs(src0.chan[n] - src1.chan[n]) + abs(src0.chan[n+1] - src1.chan[n+1]); } }

Sum of Absolute Difference Accumulate 2

sada2 - Sum of Absolute Difference Accumulate 2			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The sada2 instruction takes source data channels from src0 and src1 in groups of 2-tuples. For each 2-tuple, it computes the sum-of-absolute-difference (SAD) between src0 and src1, adds the intermediate result with the accumulator value corresponding to the first channel, and stores the scalar result in the first channel of the 2-tuple in dst. The destination operand and the accumulator maintain 16 bits per channel precision. Higher precision (guide bits) stored in the accumulator allows up to 64 rounds of sada2 instructions to be issued back to back without overflowing the accumulator. The destination register must be aligned to even word (DWord). The even words in the destination region will contain the correct data. The odd words are also written but with undefined values.</p>			
Format: [(pred)] sada2[.cmod] (exec_size) dst src0 src1			
Restriction			
Source operands cannot be accumulators.			
The execution size cannot be 1 as the computation requires at least two data channels.			
Syntax

SWTESS_BASE_ADDRESS

SWTESS_BASE_ADDRESS												
Project:	BDW											
Source:	PRM											
Length Bias:	2											
The SWTESS_BASE_ADDRESS command sets the base pointers for SW Tessellation data read access by the TE unit.												
Programming Notes												
This base address must also be comprehended in the SURFACE_STATE used by the HS kernel to write the SW tessellation data.												
Execution of this command causes a full pipeline flush, thus its use should be minimized for higher performance.

VEBOX_SURFACE_STATE

VEBOX_SURFACE_STATE	
Project:	BDW
Source:	VideoEnhancementCS
Length Bias:	2
Description	
<p>The input and output data containers accessed are called "surfaces". Surface state is sent to VEBOX via an inline state command rather than using binding tables. SURFACE_STATE contains the parameters defining each surface to be accessed, including its size, format, and offsets to its subsurfaces. The surface's base address is in the execution command. Despite having multiple input and output surfaces, we limit the number of surface states to one for input surfaces and one for output surfaces. The other surfaces are derived from the input/output surface states.</p>	
<p>The Current Frame Input surface uses the Input SURFACE_STATE</p>	
<p>The Previous Denoised Input surface uses the Input SURFACE_STATE. (For 12-bit Bayer pattern inputs this will be 8-bit.)</p>	
<p>The Current Denoised Output surface uses the Input SURFACE_STATE. (For 12-bit Bayer pattern inputs this will be 8-bit.)</p>	
<p>The STMM/Noise History Input surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.</p>	
<p>The STMM/Noise History Output surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.</p>	
<p>The Current Deinterlaced Frame Output surface uses the Output SURFACE_STATE.</p>	
<p>The Previous Deinterlaced Frame Output surface uses the Output SURFACE_STATE.</p>	
<p>The FMD per block output / per Frame Output surface uses the Linear SURFACE_STATE (see note below).</p>	
<p>The Alpha surface uses the Linear A8 SURFACE_STATE with Width/Height equal to Input Surface. Pitch is width rounded to next 64.</p>	
<p>The Vignette Correction surface uses the Linear 16-bit SURFACE_STATE with: Width = $4 * ((\text{Input Width} - 3) / 4)$ Height = $((\text{Input Height} - 3) / 4)$ Pitch in bytes is (vignette width*2) rounded to next 64.</p>	
<p>The STMM height is the same as the Input Surface height except when the input Surface Format is Bayer Pattern and the Bayer Pattern Offset is 10 or 11, in which case the height is the input height + 4. For Bayer pattern inputs when the Bayer Pattern Offset is 10 or 11, the Current Denoised Output/Previous Denoised Input will also have a height which is the input height + 4. For Bayer pattern inputs only the Current Denoised Output/Previous Denoised Input are in Tile-Y.</p>	
<p>The linear surface for FMD statistics is linear (not tiled). The height of the per block statistics is $(\text{Input Height} + 3) / 4$ - the Input Surface height in pixels is rounded up to the next even 4 and divided by 4. The width of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 16 bytes. The pitch of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 64 bytes.</p>	

VEBOX_SURFACE_STATE

The STMM surfaces must be identical to the Input surface except for the tiling mode must be Tile-Y and the pitch must be legal for Tile-Y (increased to the next larger legal pitch). If the input surface is packed (Surface Format from 0 to 3 for DN/DI) or 12/10-bit Bayer Pattern then the pitch for the STMM surface is 1/2 the pitch of the input surface (rounded up to the next larger legal Tile-Y pitch). The width and height must be a multiple of 4 rounded up from the input height.

Programming Notes

VEBOX may write to memory between the surface width and the surface pitch for output surfaces.

For 8bit Alpha input, when converting to 16bit output it is padded with 8bit zeros in the LSB.

VEBOX_SURFACE_STATE			
24	Bayer Pattern Format		
	Project:	BDW	
	Specifies the format of the Bayer Pattern:		
	Value	Name	
	0b	8-bit input at a 8-bit stride	
1b	12 or 10-bit input at a 16-bit stride. Valid data is in the MSBs		
23:21	Reserved		
	Project:	All	
	Format:	MBZ	
20	Reserved		
	Project:	BDW	
	Format:	MBZ	
19:3	Surface Pitch		
	Format:	U17 pitch in (Bytes - 1)	
	This field specifies the surface pitch in (#Bytes - 1):		
	Value	Name	Description
	[63, 131071]	For other linear surfaces	[64B, 128KB]
	[511, 131071]	For X-tiled surface	[512B, 128KB] = [1tile, 256 tiles]
	[127, 131071]	For Y-tiled surfaces	[128B,128KB] = [1 tile, 1024 tiles]
Programming Notes			
For tiled surfaces, the pitch must be a multiple of the tile width. For linear surfaces, the pitch must be a multiple of 64. If Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.			
2	Half Pitch for Chroma		
	Format:	Enable	
	This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.		
	Programming Notes		
	Must be programmed to Zero always as this field is not used		

VEBOX_SURFACE_STATE

Wait Notification

wait - Wait Notification			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
<p>The wait instruction evaluates the value of the notification count register nreg. If nreg is zero, thread execution is suspended and the thread is put in 'wait_for_notification' state. If nreg is not zero (i.e., one or more notifications have been received), nreg is decremented by one and the thread continues executing on the next instruction. If a thread is in the 'wait_for_notification' state, when a notification arrives, the notification count register is incremented by one. As the notification count register becomes nonzero, the thread wakes up to continue execution and at the same time the notification register is decremented by one. If only one notification arrived, the notification register value becomes zero. However, during the above mentioned time period, it is possible that more notifications may arrive, making the notification register nonzero again. When multiple notifications are received, software must use wait instructions to decrement notification count registers for each notification. Notification register n0.0:ud is for thread to thread communication (via the Message Gateway shared function) and n0.1:ud for host to thread communication (through MMIO registers).</p>			
Format: wait (exec_size) nreg			
Restriction			
src0 and dst must be n0.0, n0.1, or n0.2.			
Execution size must be 1 as the notification registers are scalar.			
Predication is not allowed.			
Two back-to-back wait instructions are not allowed. At minimum, a nop instruction must be inserted between two wait instructions			
Syntax

While

while - While			
Project:	BDW		
Source:	EuIsa		
Length Bias:	4		
Description			
<p>The while instruction marks the end of a do-while block. The instruction first evaluates the loop termination condition for each channel based on the current channel enables and the predication flags specified in the instruction. If any channel has not terminated, a branch is taken to a destination address specified in the instruction, and the loop continues for those channels. Otherwise, execution continues to the next instruction. It should point to the first instruction with the do label of the do-while block of code. It should be a negative number for the backward referencing. In GEN binary, JIP is at location dst and must be of type W (signed word integer). If SPF is ON, none of the PcIP are updated.</p> <p>The following table describes the 32-bit jump target offset JIP. JIP is a signed 32-bit number, added to IP pre-increment, and should point to the first instruction with the do label of the do-while block of code. It should be a negative number for the backward referencing. In GEN binary, JIP is at location src1 and must be of type D (signed dword integer).</p>			
Format: [(pred)] while (exec_size) JIP			
Restriction			
The execution size must be the same for the while instruction and any break and cont instructions of the same code block.			
Syntax			
[(pred)] while (exec_size) imm32			
Pseudocode			
Evaluate(WrEn); for (n = 0; n < 32; n++) { if (WrEn.chan[n]) { PcIP[n] = IP + JIP; } else { PcIP[n] = IP + 1; } } if (PMask == 1) { // any enabled channel true Jump(IP + JIP); }

XY_COLOR_BLT

XY_COLOR_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>COLOR_BLT is the simplest BLT operation. It performs a color fill to the destination (with a possible ROP). The only operand is the destination operand which is written dependent on the raster operation. The solid pattern color is stored in the pattern background register.</p> <p>This instruction is optimized to run at the maximum memory write bandwidth.</p> <p>The typical (and fastest) Raster operation code = F0 which performs a copy of the pattern background register to the destination.</p>

XY_FULL_BLT

XY_FULL_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source and pattern operands are the same bit width as the destination operand.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access. All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.</p> <p>The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.</p>

XY_FULL_MONO_PATTERN_BLT

XY_FULL_MONO_PATTERN_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The pattern operand is monochrome and the source operand is the same bit width as the destination operand.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access. The monochrome pattern transparency mode indicates whether to use the pattern background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the pattern foreground color is used in the ROP operation.</p> <p>All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.</p> <p>The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8. Setting both Solid Pattern Select = 1 and Mono Pattern Transparency = 1 is mutually exclusive. The device implementation results in NO PIXELS DRAWN.</p>

XY_FULL_MONO_SRC_IMMEDIATE_PATTERN_BLT

DWord		Bit	Description
Project:		BDW	
Source:		BlitterCS	
Length Bias:		2	
<p>The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source operand is a monochrome and the immediate pattern operand is the same bit width as the destination. The immediate data sizes are 64 bytes (16 DWs), 128 bytes (32 DWs), or 256 (64DWs) for 8, 16, and 32 bpp color patterns.</p> <p>The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation.</p> <p>All non-text monochrome sources are word aligned. At the end of a scan line the monochrome source, the remaining bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates which bit position within the first byte should be used as the first source pixel which corresponds to the destination X1 coordinate.</p> <p>All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.</p> <p>The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.</p> <p>Negative Stride (= Pitch) is NOT ALLOWED.</p>

XY_MONO_SRC_COPY_IMMEDIATE_BLT

XY_MONO_SRC_COPY_IMMEDIATE_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>This instruction allows the Driver to send monochrome data through the instruction stream, eliminating the read latency of the source during command execution.</p> <p>The IMMEDIATE_BLT data MUST transfer an even number of doublewords and the exact number of quadwords. DWL indicates the total number of Dwords of immediate data.</p> <p>All non-text monochrome sources are word aligned. At the end of a scan line of monochrome source, all bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates the bit position within the first byte of the scan line that should be used as the first source pixel which corresponds to the destination X1 coordinate.</p> <p>The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation. The ROP value chosen must involve source and no pattern data in the ROP operation. The monochrome source data supplied corresponds to the Destination X1 and Y1 coordinates.</p> <p>Negative Stride (= Pitch) is NOT ALLOWED.</p>

XY_PAT_CHROMA_BLT_IMMEDIATE

XY_PAT_CHROMA_BLT_IMMEDIATE			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>PAT_BLT_IMMEDIATE is used when there is no source and the color pattern is not trivial (is not a solid color only) and the pattern is pulled through the command stream. The immediate data sizes are 64 bytes (16 DWs), 128 bytes (32 DWs), or 256 (64DWs) for 8, 16, and 32 bpp color patterns.</p> <p>DWL indicates the total number of Dwords of immediate data. All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.</p> <p>The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.</p>

XY_SETUP_BLT

XY_SETUP_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>This setup instruction supplies common setup information including clipping coordinates used by the XY commands: XY_PIXEL_BLT, XY_SCANLINE_BLT, XY_TEXT_BLT, and XY_TEXT_BLT_IMMEDIATE. These are the only instructions that require that state be saved between instructions other than the Clipping parameters. There are 5 dedicated registers to contain the state for the 3 setup BLT instructions (XY_SETUP_BLT, XY_SETUP_MONO_PATTERN_SL_BLT, and XY_SETUP_CLIP_BLT). All other BLTs use a temporary version of these. The 5 double word registers are: DW1 (Setup Control), DW6 (Setup Foreground color), DW5 (Setup Background color), DW7 (Setup Pattern address), and DW4 (Setup Destination Base Address).</p>

XY_SRC_COPY_BLT

XY_SRC_COPY_BLT			
Project:	BDW		
Source:	BlitterCS		
Length Bias:	2		
<p>This BLT instruction performs a color source copy where the only operands involved is a color source and destination of the same bit width.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access. The ROP value chosen must involve source and no pattern data in the ROP operation.</p>
