Notices and Disclaimers

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

		Default Value: 4
		B credits used by VGA to request data from Display Buffer.

MCR Packet Control

MCRPKT_CTRL - MCR Packet Control			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Size (in bits):	32		
Address:	00FDCh-00FDh		
DWord	Bit	Description	
0	31	MULTICAST	
		Default Value:	1b
		Access:	R/W
		Value determines the multicast value driven to MCR. 0 - not multicast 1 - multicast The usage model is that the value is returned to the default (1), after completion of the unicast request.	
30:27		SLICEID	
		Default Value:	0000b
		Access:	R/W
Value determines the slice ID driven to MCR.			
26:24		SUBSLICEID	
		Default Value:	000b
		Access:	R/W
Value determines the subslice ID (or I3_bank) driven to MCR.			
23:0		Reserved	
		Access:	RO

If a particular allocation is done at youngest age ("3") it tends to stay longer in the cache as compared to older age allocations ("2", "1", or "0"). This option is given to driver to be able to decide which surfaces are more likely to generate HITS, hence need to be replaced least often in caches. When Target Cache(TC) == 00, LRU Age value will be from Private PAT registers(40E0/40E8/40EC) When Target Cache(TC) != 00, LRU Age value will be from MOCS as follows 11: Assign the age of "3" 10: do not change the age on a hit. 01: Assign the age of "0" 00: Take the age value from Uncore CRs</p>	Default Value:	11b	Access:	R/W

0	Media Clock Un-gate Request	Setting the Media Clock Gating Control Message to zero (0) un-gates the cmclk clock. Bit0 : media(cmclk) clock gate control for vdbox0 Bit1 : media(cmclk) clock gate control for vdbox1 Bit2 : media(cmclk) clock gate control for vdbox2 Bit3 : media(cmclk) clock gate control for vdbox3 Bit4 : media(cmclk) clock gate control for vdbox4 Bit5 : media(cmclk) clock gate control for vdbox5 Bit6 : media(cmclk) clock gate control for vdbox6 Bit7 : media(cmclk) clock gate control for vdbox7
1	Media Clock Gate Request	Setting the Media Clock Gating Control Message to one (1) gates the cmclk clock.

Media Control Surface Cache Invalidate

MCSCI - Media Control Surface Cache Invalidate			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Size (in bits):	32		
Address:	04AACH		
Description			
<p>This register can be used by SW to invalidate the RCP/WCP caches for a particular engine, asynchronous to batch execution.</p> <p>When using this register based invalidation, SW must ensure the pipeline for the engine for which the invalidation is being issued is flushed, and the engine is idle.</p>

<p>Message registers have bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16]. To set bit0, for example, the data would be 0x0001_0001. To clear bit0, for example, the data would be 0x0001_0000. Note that mask bit is the data bit offset + 16. Message registers are protected from non-GT writes via the Message Channel.</p>

MFC_AVC_CABAC_INSERTION_COUNT

AVC_CABAC_INSERTION_COUNT - MFC_AVC_CABAC_INSERTION_COUNT		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	128ACh	
This register stores the count in bytes of CABAC ZERO_WORD insertion. It is primarily provided for statistical data gathering .		
DWord	Bit	Description
0	31:0	MFC AVC Cabac Insertion Count Total number of bytes in the bitstream output before for the CABAC zero word insertion. This count is updated each time when the insertion count is incremented.

MFC_AVC Bitstream Decoding Front-End Parsing Logic Error Counter

MFC_VIN_AVD_ERROR_CNTR - MFC_AVC Bitstream Decoding Front-End Parsing Logic Error Counter			
Register Space:	MMIO: 0/2/0		
Source:	VideoCS		
Access:	R/W		
Size (in bits):	32		
Trusted Type:	1		
Address:	12804h		
DWord		Bit	Description
0 avd_error_flagsR[31:0]		31:0	Reserved Format: MBZ

MFC Image Status Control

MFC_IMAGE_STATUS_CONTROL - MFC Image Status Control				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS			
Access:	RO			
Size (in bits):	32			
Trusted Type:	1			
Address:	128B8h			
This register stores the suggested data for next frame in multi-pass.				
DWord	Bit	Description		
0	31:24	Cumulative slice delta QP		
	23:16	QP Value suggested slice QP delta value for frame level Rate control. This value can be +ve or -ve		
	15	QP-Polarity Change Cumulative slice delta QP polarity change.		
	14:13	Num-Pass Polarity Change Number of passes after cumulative slice delta QP polarity changes.		
	12	VDENC Slice Overflow Error Occurred <table border="1" data-bbox="332 1117 1469 1207"> <tr> <td>Format:</td> <td>U1</td> </tr> </table> True when slice size exceeds slice max size on final pass when VDENC is using attempting to use slice overflow prevention.	Format:	U1
	Format:	U1		
	11:8	Total Num-Pass		
	7:4	Reserved <table border="1" data-bbox="332 1402 1469 1453"> <tr> <td>Format:</td> <td>MBZ</td> </tr> </table>	Format:	MBZ
	Format:	MBZ		
	3	Missing Huffman Code <table border="1" data-bbox="332 1497 1469 1547"> <tr> <td></td> <td></td> </tr> </table> Jpeg HW encoder reports if Huffman table entry is missing.		
2	Panic Panic triggered to avoid too big packed file.			
1	Frame Bit Count Frame Bit count over-run/under-run flag			
0	Max Conformance Flag Max Macroblock conformance flag or Frame Bit count over-run/under-run			

MFC Image Status Mask

MFC_IMAGE_STATUS_MASK - MFC Image Status Mask		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	128B4h	
This register stores the image status(flags).		
DWord	Bit	Description
0	31:0	Control Mask Control Mask for dynamic frame repeat.

MFC QP Status Count

MFC_QUP_CT - MFC QP Status Count				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS			
Access:	RO			
Size (in bits):	32			
Trusted Type:	1			
Address:	128BCh			
This register stores the suggested QP COUNTS in multi-pass.				
DWord	Bit	Description		
0	31:24	Cumulative QP Adjust <table border="1" style="width: 100%;"> <tr> <td style="width: 70%;">Format:</td> <td style="width: 30%;">U8</td> </tr> </table> <p>Cumulative QP adjustment after multiple passes. If there is no need to multi-pass, this value would be zero. (This is in sign magnitude form).</p>	Format:	U8
	Format:	U8		
23:0	Cumulative QP <table border="1" style="width: 100%;"> <tr> <td style="width: 70%;">Format:</td> <td style="width: 30%;">U24</td> </tr> </table> <p>Cumulative QP for all MB of a Frame (Can be used for computing average QP).</p>	Format:	U24	
Format:	U24			

MFD Error Status

MFD_ERROR_STATUS - MFD Error Status		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO

<p>This register stores the max and min memory latency counts reported on reference read requests. This register is not part of hardware context save and restore.</p>	
DWord	Bit
Description	

MFX_LAT_CT1 - MFX_Memory_Latency_Count1

0	31:24	Max Request Count This field indicates the maximum number of requests allowed by the memory sub-system channel.
	23:16	Current Request Count This field indicates the number of requests currently outstanding in the memory sub-system. This field should report with a value of zero at the end of frame; otherwise the motion compensation engine is most likely hung waiting for read data to be returned from sub-system.
	15:8	MFX Reference picture read request - Max Latency Count in 8xMedia clock cycles This field reports the maximum memory latency count on all reference reads requested by the motion compensation engine.
	7:0	MFX Reference picture read request - Min Latency Count in 8xMedia clock cycles This field reports the minimum memory latency count on all reference reads requested by the motion compensation engine.

MFX0 Fault Counter

MFX0_FAULT_CNTR - MFX0 Fault Counter		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Size (in bits):	32	
Address:	045A8h	
DWord	Bit	Description
0	31:0	MFX0 Fault Counter
		Default Value: 00000000h
		Access: RO
		This counter only applies to advance context when fault and stream mode is selected.

MFX0 Fixed Counter

MFX0_FIXED_CNTR - MFX0 Fixed Counter			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Size (in bits):	32		
Address:	045ACh		
DWord	Bit	Description	
0	31:0	MFX0 Fixed Counter	
		Default Value:	00000000h
		Access:	RO
		This counter only applies to advance context when fault and stream mode is selected.	

MFX1 Fault Counter

MFX1_FAULT_CNTR - MFX1 Fault Counter						
Register Space:	MMIO: 0/2/0					
Source:	BSpec					
Size (in bits):	32					
Address:	045B0h					
DWord	Bit	Description

Address:	1F4868h	
Description:	For VDBox7	
This register stores the number of Macro-blocks decoded/encoded in current frame. This register is not part of hardware context save and restore.		
DWord	Bit	Description

MFX_MB_COUNT - MFX Frame Macroblock Count

0	31:20	MBZ	
		Exists If:	// JPEG == True
		Format:	MBZ
		This field is currently reserved	
	31:16	Intra MB Count	
		Exists If:	// AVC CAVLC, AVC CABAC, VC1 and MPEG2 == True
		Format:	U16
	19:0	JPEG Block Count	
		Exists If:	// JPEG == True
		Format:	U20
		This 20-bit field indicates the number of 8x8 blocks within the JPEG frame. This field is clear at the start of decoding a new frame.	
	15:0	Number of MB Concealment	
		Exists If:	// AVC CAVLC, AVC CABAC, VC1 and MPEG2 == True
		This 16-bit field indicates the number of MB is concealed by hardware. This field is clear at the start of decoding a new frame.	

MFX Frame Row-Stored/BitStream Read Count

MFX_ROW-PER-BS_COUNT - MFX Frame Row-Stored/BitStream Read Count				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS			
Access:	RO			
Size (in bits):	32			
Trusted Type:	1			
Address:	12880h			
This register stores the total number of row-stored/bit-stream read requests made by the pre-fetch engine per frame. This register is not part of hardware context save and restore.				
DWord	Bit	Description		
0	31:16	Reserved Format: <table border="1"><tr><td> </td><td>MBZ</td></tr></table>		MBZ
		MBZ		
15:0	MFX row-stored/bit-stream read request Count Total number of row-stored/bit-stream read requests sent by the memory pre-fetch engine per frame.			

MFx PAK MPEG TS STATUS

MFx_PAK_MPEG_TS_STATUS - MFx PAK MPEG TS STATUS				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS			
Access:	RO			
Size (in bits):	32			
Trusted Type:	1

DWord	Bit	Description
0	31:27	i_dither_value DCO Dither Override Value
	26	i_ovc_snapshot_h

MG_PLL_FRAC_LOCK

		This bit enables for LCPLL to take snapshot of PLL calibration states and integral component.										
25	i_fbdiv_strobe_h	Propagate bit for LCPLL to capture feedback divider ratio settings and feedfwrdd gain for dynamic PLL frequency update. This bit is automatically cleared after divratio ratio settings captured. (hw clear).										
24	i_pllrampen_h	This need to be asserted for dynamically updating PLL frequency configuration. In normal POR mode, i_pllrampen_h = 0, and no register update is allowed while PLL is running. This needs to be set for dynamic PPM shift. User needs to disable this register after PPM change, to prevent auto change of AFC code when fine is code below 1/4 or above 3/4 due to PVT variation.

Mirror of Global Command Register

GCMD - Mirror of Global Command Register				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Size (in bits):	32			
Address:	090CCh			
DWord	Bit	Description		
0	31	<p>Translation Enable</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 80%;">Access:</td> <td style="width: 20%;">RO</td> </tr> </table> <p>Software writes to this field to request hardware to enable/disable DMA-remapping hardware. 0: Disable DMA-remapping hardware. 1: Enable DMA-remapping hardware. Hardware reports the status of the translation enable operation through the TES field in the Global Status register. Before enabling (or re-enabling) DMA-remapping hardware through this field, software must:</p> <ul style="list-style-type: none"> • Setup the DMA-remapping structures in memory. • Flush the write buffers (through WBF field), if write buffer flushing is reported as required. • Set the root-entry table pointer in hardware (through SRTP field). • Perform global invalidation of the context-cache and global invalidation of IOTLB • If advanced fault logging supported, setup fault log pointer (through SFL field) and enable advanced fault logging (through EAFL field). <p>Refer to Section 9 for detailed software requirements. There may be active DMA requests in the platform when software updates this field. Hardware must enable or disable remapping logic only at deterministic transaction boundaries, so that any in-flight transaction is either subject to remapping or not at all. Hardware implementations supporting DMA draining must drain any in-flight translated DMA read/write requests queued within the root complex before completing the translation enable command and reflecting the status of the command through the TES field in the GSTS_REG. Value returned on read of this field is undefined.</p>	Access:	RO
Access:	RO			
	30	<p>Set Root Table Pointer</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 80%;">Access:</td> <td style="width: 20%;">RO</td> </tr> </table> <p>Software sets this field to set/update the root-entry table pointer used by hardware. The root-entry table pointer is specified through the Root-entry Table Address register. Hardware reports the status of the "root table pointer set" operation through the RTPS field in the Global Status register. The root table pointer set operation must be performed before enabling or re-enabling (after disabling) DMA remapping through the TE field. After a "root table pointer set" operation, software must globally invalidate the context cache and</p>	Access:	RO
Access:	RO			

GCMD - Mirror of Global Command Register

then globally invalidate the IOTLB. This is required to ensure hardware uses only the remapping structures referenced by the new root table pointer, and not any stale cached entries. While DMA remapping is active, software may update the root table pointer through this field. However, to ensure valid in-flight DMA requests are deterministically remapped, software must ensure that the structures referenced by the new root table pointer are programmed to provide the same remapping results as the structures referenced by the previous root-table pointer. Clearing this bit has no effect. The value returned on a read of this field is undefined.

29 Set Fault Log

Access:	RO
---------	----

This field is valid only for implementations supporting advanced fault logging. Software sets this field to request hardware to set/update the fault-log pointer used by hardware. The fault-log pointer is specified through Advanced Fault Log register. Hardware reports the status of the fault log set operation through the FLS field in the Global Status register. The fault log pointer must be set before enabling advanced fault logging (through EAFL field). Once advanced fault logging is enabled, the fault log pointer may be updated through this field while DMA remapping is active. Clearing this bit has no effect. The value returned on read of this field is undefined.

28 Enable Fault Logging

Access:	RO
---------	----

This field is valid only for implementations supporting advanced fault logging. Software writes to this field to request hardware to enable or disable advanced fault logging. 0: Disable advanced fault logging. In this case, translation faults are reported through the Fault Recording registers. 1: Enable use of memory-resident fault log. When enabled, translation faults are recorded in the memory-resident log. The fault log pointer must be set in hardware (through SFL field) before enabling advanced fault logging. Hardware reports the status of the advanced fault logging enable operation through the AFLS field in the Global Status register. Value returned on read of this field is undefined.

27 Write Buffer Flush

Access:	RO
---------	----

This bit is valid only for implementations requiring write buffer flushing. Software sets this field to request hardware to flush the root-complex internal write buffers. This is done to ensure any updates to the memory-resident remapping structures are not held in any internal write posting buffers. Refer to Section 11.1 for details on write-buffer flushing requirements. Hardware reports the status of the write buffer flushing operation through the WBFS field in the Global Status register. Clearing this bit has no effect.

GCMD - Mirror of Global Command Register

	Value returned on read of this field is undefined.	
26	Queued Invalidation Enable	
	Access:	RO
	<p>This field is valid only for implementations supporting queued invalidations. Software writes to this field to enable or disable queued invalidations.</p> <p>0: Disable queued invalidations. 1: Enable use of queued invalidations.</p> <p>Hardware reports the status of queued invalidation enable operation through QIES field in the Global Status register.</p> <p>Refer to Section 6.2.2 for software requirements for enabling/disabling queued invalidations. The value returned on a read of this field is undefined.</p>	
25	Interrupt Remapping Enable	
	Access:	RO
	<p>This field is valid only for implementations supporting interrupt remapping.</p> <p>0: Disable interrupt-remapping hardware 1: Enable interrupt-remapping hardware</p> <p>Hardware reports the status of the interrupt remapping enable operation through the IRES field in the Global Status register.</p> <p>There may be active interrupt requests in the platform when software updates this field. Hardware must enable or disable interrupt-remapping logic only at deterministic transaction boundaries, so that any in-flight interrupts are either subject to remapping or not at all.</p> <p>Hardware implementations must drain any in-flight interrupts requests queued in the Root-Complex before completing the interrupt-remapping enable command and reflecting the status of the command through the IRES field in the Global Status register.</p> <p>The value returned on a read of this field is undefined.</p>	
24	Set Interrupt Remap Table Pointer	
	Access:	RO
	<p>This field is valid only for implementations supporting interrupt-remapping. Software sets this field to set/update the interrupt remapping table pointer used by hardware. The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address register.</p> <p>Hardware reports the status of the interrupt remapping table pointer set operation through the IRTPS field in the Global Status register.</p> <p>The interrupt remap table pointer set operation must be performed before enabling or re-enabling (after disabling) interrupt-remapping hardware through the IRE field.</p> <p>After an interrupt remap table pointer set operation, software must globally invalidate the interrupt entry cache. This is required to ensure hardware uses only the interrupt-remapping entries referenced by the new interrupt remap table pointer, and not any stale cached entries. While interrupt remapping is active, software may update the interrupt remapping table pointer through this field. However, to ensure valid in-flight interrupt requests are deterministically remapped, software must ensure that the structures referenced by the new interrupt remap table</p>

Mirror of Graphics Translation Table and Memory Mapped Range Address (31:0)

GTTMMADR_LSB - Mirror of Graphics Translation Table and Memory Mapped Range Address (31:0)				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Size (in bits):	32			
Address:	09124h			
<p>This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with 2MB of that used by MMIO and 2MB used by GTT. GTTADR begins at (GTTMMADR + 2 MB) while the MMIO base address is the same as GTTMMADR.</p> <p>For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area.</p> <p>The device snoops writes to this region in order to invalidate any cached translations within the various TLBs implemented on-chip. There are some exceptions to this - see GTT-TLB in the Programming Interface chapter. The allocation is for 4MB and the base address is defined by bits [38:22].</p>

Mirror of Graphics Translation Table and Memory Mapped Range Address UDW

GTTMMADR_MSB - Mirror of Graphics Translation Table and Memory Mapped Range Address UDW				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Size (in bits):	32			
Address:	09128h			
<p>This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with 2MB of that used by MMIO and 2MB used by GTT. GTTADR begins at (GTTMMADR + 2 MB) while the MMIO base address is the same as GTTMMADR.</p> <p>For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area.</p> <p>The device snoops writes to this region in order to invalidate any cached translations within the various TLBs implemented on-chip. There are some exceptions to this - see GTT-TLB in the Programming Interface chapter. The allocation is for 4MB and the base address is defined by bits [38:22].</p>

Mirror of PCICMD MAE/BME

PCICMD - Mirror of PCICMD MAE/BME		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Size (in bits):	32	
Address:	0912Ch	
DWord	Bit	Description
0	31:11	Spare Access: R/W
	10	Interrupt Disable Access: R/W This bit disables the device from asserting INTx#. 0: Enable the assertion of this device's INTx# signal. 1: Disable the assertion of this device's INTx# signal. DO_INTx messages are not sent to DMI. GSA Implementation: When 1, blocks the sending of an MSI interrupt and blocks the sending of a Line interrupt. (The interrupt status is not blocked from being reflected in the INTSTS bit.) When 0, permits the sending of an MSI interrupt or Line interrupt.
	9	Fast Back to Back Access: R/W Not Implemented. Hardwired to 0.
	8	SERR Enable Access: R/W Not Implemented. Hardwired to 0.
	7	Address/Data Stepping Enable Access: R/W Not Implemented. Hardwired to 0.
	6	Parity Error Enable Access: R/W Not Implemented. Hardwired to 0. Since the IGD belongs to the category of devices that does not corrupt programs or data in system memory or hard drives, the IGD ignores any parity error that it detects and continues with normal operation.
	5	Video Pallete Snooping

PCICMD - Mirror of PCICMD MAE/BME

MMIO_INDEX

MMIO_INDEX - MMIO_INDEX						
Register Space:	MMIO: 0/2/0					
Source:	BSpec					
Size (in bits):	32					
Address:	00000h					
<p>Contains address and target. Punit cannot access IO space from message channel. A 32 bit IO write to this port loads the offset of the MMIO register or offset into the GTT that needs to be accessed. An IO Read returns the current value of this register. An 8/16 bit IO write to this register is completed but does not update this register. This mechanism to access internal graphics MMIO registers must not be used to access VGA IO registers which are mapped through the MMIO space. VGA registers must be accessed directly through the dedicated VGA IO ports. This is used by SBIOS. It is not used by graphics driver. This register is only accessible through the IOSF Primary bus. The base register is defined by IOBAR.</p>						
DWord	Bit	Description				
0	31:2	Register_offset <table border="1" style="width: 100%;"> <tr> <td>Default Value:</td> <td style="text-align: right;">00000000h</td> </tr> <tr> <td>Access:</td> <td style="text-align: right;">R/W</td> </tr> </table> <p>This field selects GTT entry or any one of the Dword registers within the MMIO register space of this device.</p>	Default Value:	00000000h	Access:	R/W

MI_MODE - Mode Register for Software Interface

14	RCS POSH LRCA Disable			
	Source:			RenderCS
	Exists If:			//RCS
	<p>This bit controls the context save of the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA as part of the RCS context image. This primary purpose of this bit is for backward compatibility for the render context image.</p>			
	Value	Name	Description	
	1		RCS saves the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA in context image as NOOPs.	
	0	[Default]	RCS saves the MI_LOAD_REGISTER_IMM command corresponding to POSH_LRCA as part of the context image.	
13	Disable MI_SET_CONTEXT for Execution List			
	Format:			U1
	Value	Name	Description	
	0h	Allow [Default]	Allow MI_SET_CONTEXT in Execlist mode	
	1h	Disable	Disable MI_SET_CONTEXT in Execlist Mode	
12	Reserved			
	Format:			PBC
11	Invalidate UHPTR enable			
	Source:	RenderCS, VideoCS, VideoCS2, VideoEnhancementCS		
	Exists If:	//RCS, VCS, VECS, BCS		
	Format:	Enable		
	<p>If bit set H/W clears the valid bit of UHPTR (2134h, bit 0) when current active head pointer is equal to UHPTR.</p>			
11	Reserved			
	Source:			PositionCS
	Exists If:			//POCS
10	Atomic Read Return for MI_COPY_MEM_MEM			
	Format:			U1
	Value	Name	Description	
	0h	Disable	Hardware does a regular memory fence write to complete the write to	

MI_MODE - Mode Register for Software Interface

			[Default]	the destination address before moving to the next instruction.
	1h		Enable	Hardware does Atomic Move with Read Return to complete the write to the destination address before moving to the next instruction.
9	Rings Idle			
	Format:			U1
	Read Only Status bit			
	Value	Name	Description	
	0h	Not Idle [Default]	Parser not Idle or Ring Arbiter not Idle.	
	1h	Idle	Parser Idle and Ring Arbiter Idle.	
	Programming Notes			
	Writes to this bit are not allowed.			
8	Stop Rings			
	Format:			U1
	Value	Name	Description	
	0h	[Default]	Normal Operation.	
	1h		Parser is turned off and Ring arbitration is turned off.	
	Programming Notes			
	Software must set this bit to force the Rings and Command Parser to Idle. Software must read a 1 in the Ring Idle bit after setting this bit to ensure that the hardware is idle.			
	Software must clear this bit for Rings to resume normal operation.			
7:5	Reserved			
	Format:			PBC
4:2	Reserved			
	Source:	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS		
	Format:	PBC		
4:1	Predicate Enable			
	Source:			RenderCS, PositionCS
	This field gets set when "MI_SET_PREDICATE" command is parsed by render command streamer. Predicate Disable is the default mode of operation.			
	Value	Name	Description	
	0h	Predicate Disable	Predication is Disabled and RCS will process commands as usual.	
	1h	Predicate on	Following Commands will be NOOPED by RCS only if the	

MI_MODE - Mode Register for Software Interface

	Result2 clear	MI_PREDICATE_RESULT_2 is clear.
2h	Predicate on Result2 set	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT_2 is set.
3h	Predicate on Result clear	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT is clear.
4h	Predicate on Result set	Following Commands will be NOOPED by RCS only if the MI_PREDICATE_RESULT is set.
5h	Predicate when two or more slices enabled	Following Commands will be NOOPED by RCS only when one slice is enabled, NOOPED when more than one slice is enabled.
6h	Predicate when one or three slices enabled	Following Commands will be Executed by RCS only when two slices are enabled, NOOPED when one or three slices are enabled.
7h	Predicate when one or two slices enabled	Following Commands will be Executed by RCS only when all the three slices are enabled, NOOPED when less than three slices are enabled.
Bh	NOOP in RenderCS	<p>When RenderCS parses MI_SET_PREDICATE command with "Predicate Enable" set to "NOOP in RenderCS", RenderCS NOOP's all the subsequent commands parsed unconditionally until the predication is disabled/modified using MI_SET_PREDICATE command.</p> <p>Other command streamers (non RenderCS) on parsing MI_SET_PREDICATE command with "Predicate Enable" set to "NOOP in RenderCS" don't take any action and is equivalent to parsing MI_NOOP command.</p>
Ch	NOOP in PositionCS	<p>When PositionCS parses MI_SET_PREDICATE command with "Predicate Enable" set to "NOOP in PositionCS", PositionCS NOOP's all the subsequent commands parsed unconditionally until the predication is disabled/modified using MI_SET_PREDICATE command.</p> <p>Other command streamers (non PositionCS) on parsing MI_SET_PREDICATE command with "Predicate Enable" set to "NOOP in PositionCS" don't take any action and is equivalent to parsing MI_NOOP command.</p>
8h, 9h, Ah	Reserved	
Dh, Eh	Reserved	
Fh	Predicate Always	Following Commands will be NOOPED by RCS unconditionally.

MI_MODE - Mode Register for Software Interface

Programming Notes							
SW must use MI_SET_PREDICATE instead of MMIO access.

Null Range 0 Base Register

NULL_BASE_0 - Null Range 0 Base Register				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Size (in bits):	32			
Address:	04050h			
DWord	Bit	Description		
0	31:21	Null Range Base Address		
		Default Value:	00000000000b	
		Access:	R/W Lock	
		Base address contents of the Null Range that has to be checked against.		
	20:2	Reserved		
		Default Value:	0000000000000000000b	
		Access:	RO	
	1	Null Range Register Lock	Default Value:	0b
			Access:	R/W
			When set, The null range register is locked. Writes have no impact on the register and reads continue to return the contents.	
			Note that enable and lock can be written in the same cycle, as lock taking effect, the accompanying update to the register will take effect as well.	
0		Null Range Enable	Default Value:	0b
			Access:	R/W Lock
		When set, The null range register is enabled. Hardware will detect the accesses falling into null range and treat them as invalid access where writes are dropped and reads are returned with all zero's.		

Null Range 1 Base Register

NULL_BASE_1 - Null Range 1 Base Register			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Size (in bits):	32		
Address:	04054h		
DWord	Bit	Description	
0	31:7	Reserved	
		Default Value:	000000000000000000000000b
		Access:	RO
	6:0	Null Range Base Address	
		Default Value:	0000000b
		Access:	R/W Lock
		Base address contents of the Null Range that has to be checked against.	

OAG Interrupt Mask Register

OAG_OA_IMR - OAG Interrupt Mask Register				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Access:	R/W			
Size (in bits):	32			
Address:	0DB14h			
The OAIMR register is used by software to control whether OA generates an interrupt or not.				
DWord	Bit	Description		
0	31:29	Reserved		
		Default Value: 7h		
		Format: PBC		
	28	Mask Bit		
		Value	Name	Description
		0h	Not Masked	May generate an interrupt
		1h	Masked [Default]	Will not generate an interrupt
	27:0	Reserved		
		Default Value: FFFFFFFh		
		Format: PBC		

OA Interrupt Mask Register

OA_IMR - OA Interrupt Mask Register				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Access:	R/W			
Size (in bits):	32			
Address:	02B20h			
The OAIMR register is used by software to control whether OA generates an interrupt or not.				
DWord	Bit	Description		
0	31:29	Reserved		
		Default Value:	7h	
		Format:	PBC	
	28	Mask Bit		
		Value	Name	Description
		0h	Not Masked	May generate an interrupt
		1h	Masked [Default]	Will not generate an interrupt
	27:0	Reserved

1	Disable Overrun Mode <div style="border: 1px solid black; height: 20px; width: 100%;"></div>																												

OABUFFER - Observation Architecture Buffer

Format:	Enable
---------	--------

This field defines the mode of reporting for internal trigger/timer based reporting. When this bit is set, overrun does not lose reports but stops reporting. Based on the head and tail pointer, when HW detects room for the report, it would resume reporting to the buffer. This mode would not set the over-run bit in the register. When this mode bit is reset, buffer overrun can happen and lose the reports while setting the buffer over-run bit.

Value	Name	Description
0h	Disable [Default]	Counter gets written out on regular intervals, defined by the Timer Period
1h	Enable	Counter does not get written out on regular interval

0 Memory Select PPGTT/GGTT Access

--	--

Value	Name
0h	PPGTT
1h	GGTT [Default]

Programming Notes

When each context has its own Per Process GTT, this field should be always set to GGTT. Since all known drivers use PPGTT today, OABUFFER using PPGTT memory is a deprecated configuration.

Observation Architecture Control

OACONTROL - Observation Architecture Control		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Access:	R/W	
Size (in bits):	32	
Address:	02B00h	
Name:	Observation Architecture Control	
ShortName:	OACONTROL	
This register controls global OA functionality, report format, interrupt steering and context filtering.		
DWord	Bit	Description
0	31:6	Reserved
		Format: PBC
	5	Reserved
	4:2	Counter Select This field selects which performance counter report format to use, please refer to Performance Counter Report Formats section for more details on the structure of the format.
1	1	Specific Context Enable
		Format: Enable
	Description	
	Enables counters to work on a context specific workload. The context is given by bits 31:12. OA unit level clock gating must be ENABLED when using specific ContextID feature. When "Specific Context Enable" bit is set to '1' in OACONTROL register, Boolean/Threshold report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit is set to '0' in OACONTROL register, Boolean/Threshold report trigger function gets enabled for all contexts. When "Specific Context Enable" bit is set to '1' in OACONTROL register, Timer based report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit is set to '0' in OACONTROL register, Timer based report trigger function gets enabled for all	

OACONTROL - Observation Architecture Control

contexts.

Value	Name	Description
0h	Disable [Default]	All contexts are considered
1h	Enable	Only the contexts with the Select Context ID field in OACTXID are considered

0 Performance Counter Enable

Format:	Enable

Global performance counter enable. If clear, no counting will occur. MI_REPORT_PERF_COUNT is undefined when clear.

Programming Notes

When this bit is set, OABUFFER, OAHEADPTR and OATAILPTR must be programmed correctly to ensure report triggers due to Context Switch and GO transition happen correctly.

Observation Architecture Control Context ID

OACTXID - Observation Architecture Control Context ID		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	32	
Address:	02364h	
Name:	Observation Architecture Control Context ID	
ShortName:	OACTXID	
<p>This register has the context details when Specific context Enable is set. This register is implemented in render command streamer and render context save/restored. This register should be initialized by SW appropriately on the very first submission of a context when OA is enabled.</p>		
DWord	Bit	Description
0	31:0	<p>Select Context ID Specifies the context ID of the one context that affects the performance counters when "Specific Context Enable" bit is set. All other contexts are ignored. Ring Buffer Mode of Scheduling: Bits[31:12] represent the CCID and bits [11:0] must be zero. Execlist mode of scheduling: Bits[31:0] represent the context id.</p>

Observation Architecture Control per Context

OACTXCONTROL - Observation Architecture Control per Context		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	32	
Address:	02360h	
Name:	Observation Architecture Control per Context	
ShortName:	OACTXCONTROL	
<p>This register is implemented in render command streamer and render context save/restored. This register should be initialized by SW appropriately on the very first submission of a context when OA is enabled.</p>		
DWord	Bit	Description
0	31	Reserved
		Format: PBC
	30:8	Reserved
		Format: PBC
7:2	<p>Timer Period</p> <p>Specifies the period of the timer strobe as a function of the minimum TIME_STAMP resolution. The period is determined by selecting a specified bit from the TIME_STAMP register as follows: $\text{StrobePeriod} = \text{MinimumTimeStampPeriod} * 2^{(\text{TimerPeriod} + 1)}$ The exponent is defined by this field.</p> <p>Note: The TIME_STAMP is not reset at start time so the phase of the strobe is not synchronized with the enable of the OA unit. This could result in approximately a full StrobePeriod elapsing prior to the first trigger. Usage for this mechanism should be time based periodic triggering, typically.</p>	
1	<p>Timer Enable</p> <p>Description</p> <p>This field enables the timer logic to output a periodic strobe, as defined by the Timer Period. When disabled the timer output is not asserted. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report.</p> <p>When "Specific Context Enable" bit is set to '1' in OACONTROL register, Timer based report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit is</p>	

OACTXCONTROL - Observation Architecture Control per Context

	set to '0' in OACONTROL register, Timer based report trigger function gets enabled for all contexts.		
	Value	Name	Description
	0h	Disable [Default]	Counter does not get written out on regular interval
	1h	Enable	Counter gets written out on regular intervals, defined by the Timer Period
0	Counter Stop-Resume Mechanism		
	Value	Name	Description
	1h		resume counting for all counters

Observation Architecture Head Pointer

OAHEADPTR - Observation Architecture Head Pointer			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Access:	R/W		
Size (in bits):	32		
Address:	02B0Ch		
This register allows SW to program head pointer.			
DWord	Bit	Description	
0	31:6	<p>Head Pointer Virtual address of the internal trigger based buffer that is updated by software after consuming reports from the report buffer. This pointer must be updated by SW only when using time or event-based report triggering.</p> <p style="text-align: center;">Programming Notes</p> <p>SW must ensure that Head Pointer and the Tail Pointer match before enabling internally triggered performance counter reporting.</p>	
	5:0	<p>Reserved</p> <table border="1" style="width: 100%;"> <tr> <td>Format:</td> <td>PBC</td> </tr> </table>	Format:
Format:	PBC		

Observation Architecture Report Trigger 2

OAREPORTTRIG2 - Observation Architecture Report Trigger 2				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Access:	R/W			
Size (in bits):	32			
Address:	02744h			
Description				
<p>This register controls some of the Boolean logic defining Boolean/threshold report trigger 0. The bit definitions in this register refer to the stages in the report trigger block diagram in the Performance Counter Reporting section.</p> <p>Report triggers generated from OAREPORTTRIG 1-4 and OAREPORTTRIG 5-8 are ORed to form a new report trigger. Report trigger behavior can be derived by programming these two sets of OA REPORT registers with the same value. Users should be aware that while programming Timer based and Threshold Counter based triggers simultaneously for internal reporting, they should be programmed such way that they are not consecutively triggered. If programmed simultaneously, RTL pulse detection logic will have problem when these triggers occur in consecutive clock cycles.</p>				
DWord	Bit	Description		
0	31	<p>Report Trigger Enable</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 70%;">Format:</td> <td>Enable</td> </tr> </table> <p style="text-align: center;">Description</p> <p>Enable Boolean/threshold report trigger 0. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report.</p> <p>When "Specific Context Enable" bit set to '1' in OACONTROL register, Boolean/Threshold report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit set to '0' in OACONTROL register, Boolean/Threshold report trigger function gets enabled for all contexts.</p>	Format:	Enable

Observation Architecture Report Trigger 6

OAREPORTTRIG6 - Observation Architecture Report Trigger 6				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Access:	R/W			
Size (in bits):	32			
Address:	02754h			
Description				
<p>This register controls some of the Boolean logic defining Boolean/threshold report trigger 1. Note that Boolean report triggers 0 and 1 are logically OR'd together without buffering, this implies that only one performance counter report will be generated for clocks where both Boolean report triggers evaluate true. The bit definitions in this register refer to the stages in the report trigger block diagram in the Performance Counter Reporting section.</p>				
<p>Report triggers generated from OAREPORTTRIG 1-4 and OAREPORTTRIG 5-8 are ORed to form a new report trigger. Report trigger behavior can be derived by programming these two sets of OA REPORT registers with the same value. Users should be aware that while programming Timer based and Threshold Counter based triggers simultaneously for internal reporting, they should be programmed such way that they are not consecutively triggered. If programmed simultaneously, RTL pulse detection logic will have problem when these triggers occur in consecutive clock cycles.</p>				
DWord	Bit	Description		
0	31	<p>Report Trigger Enable</p> <p style="text-align: center;">Description</p> <p>Enable Boolean/threshold report trigger 0. Users should be aware that the timer-based report logic and the Boolean report trigger logic are logically OR'd together with no buffering of report triggers. This implies that only one performance counter report will be generated for clocks where both the timer-based report logic and the Boolean report trigger logic trigger a performance counter report.</p> <p>When "Specific Context Enable" bit set to '1' in OACONTROL register, Boolean/Threshold report trigger function gets enabled only for the selected context. When "Specific Context Enable" bit set to '0' in OACONTROL register, Boolean/Threshold report trigger function gets enabled for all contexts.</p>

0	Invert A Enable 0 Invert the specified signal at the A stage of the Boolean/threshold report trigger 1 logic (see block diagram in the Performance Counter Reporting section).

Observation Architecture Report Trigger Counter

OARPTTRIG_COUNTER - Observation Architecture Report Trigger Counter		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Access:	R/W	
Size (in bits):	32	
Address:	02B1Ch	
This register provides status of report trigger threshold count 1 and 2. This register is for HW internal purpose and power context save/restored. This register must not be programmed by SW.		
DWord	Bit	Description
0	31:16	Report Trig Threshold Count 1 Status Programming Notes This field is for HW internal use to context save/restore rpt trigger threshold count 1. It always indicates current value of HW's internal report trigger count. SW should not program these bits.
	15:0	Report Trig Threshold count 2 status Programming Notes This field is for HW internal use to context save/restore rpt trigger threshold count 2. It always indicates current value of HW's internal report trigger count. SW should not program these bits.

Observation Architecture Start Trigger 5

OASTARTTRIG5 - Observation Architecture Start Trigger 5		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Access:	R/W	
Size (in bits):	32	
Address:	02720h	
<p>This register provides the threshold value optionally used to define the start trigger for B7-B4 counters. Note that the value in this register must match the value in OASTARTTRIG1 to have B7-B0 start at the same time. The bit definition in this register refers to the stages in the start trigger block diagram in the Performance Counter Reporting section.</p>		
DWord	Bit	Description
0	31:16	Reserved
		Format: PBC
	15:0	Threshold Value
		Format: U16
Programming Notes		
		Threshold value for the compare logic within the start trigger logic for B7-B4 counters.

Observation Architecture Start Trigger Counter

OASTARTTRIG_COUNTER - Observation Architecture Start Trigger Counter		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Access:	R/W	
Size (in bits):	32	
Address:	02B18h	
This register provides status of start trigger threshold count 1 and 2. This register is for HW internal purpose.		
DWord	Bit	Description
0	31:16	Start Trig Threshold Count 1 Status Programming Notes This field is for HW internal use to context save/restore start trigger threshold count 1. It always indicates current value of HW's internal start trigger count. SW should not program these bits.
	15:0	Start Trig Threshold count 2 status Programming Notes : This field is for HW internal use to context save/restore start trigger threshold count 2. It always indicates current value of HW's internal start trigger count. SW should not program these bits.

Observation Architecture Status Register

OASTATUS - Observation Architecture Status Register			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Access:	R/W		
Size (in bits):	32		
Address:	02B08h		
<p>This register provides status of report buffer and overflow conditions as well as status of some flags which hardware needs for internal purpose. Software should not program these status bits.</p>			
DWord	Bit	Description	
0	31:22	Reserved	
		Default Value:	0
		Format:	PBC
	21	Start Trigger Flag 1	
		Value	Name
		0	[Default]
		1	
		Programming Notes	
		This bit is for HW internal use to context save /restore Start Trigger 1 occurrence On RC6 entry. Software should not program this bit.	
	20	Start Trigger Flag 2	
Value		Name	
0		[Default]	
1			
Programming Notes			
This bit is for HW internal use to context save /restore Start Trigger 2 occurrence On RC6 entry. Software should not program this bit.			
19	Report Trigger Flag 1

Source:	BSpec			
Size (in bits):	32			
Address:	0E454h			
Name:	PAGE_FAULT_MODE			
ShortName:	PAGE_FAULT_MODE			
This register is written as part of Context Submission to TDL. The data written is the lower 32 bits of the Context Descriptor Format structure.				
DWord	Bit	Description		
0	31:8	Reserved		
		Default Value:	000000000000000b	
		Access:	RO	
	7:6	FAULT_MODE		
		Access:	WO	
		Fault Model: Applicable only in advanced context		
		Value	Name	Description
		00b	Fault and Hang [Default]	In Legacy Context mode, this is the only valid encoding.
		01b	Fault and Halt	Restriction : Only valid in Advanced Context mode.
		010b	Fault and Stream	Restriction : Only valid in Advanced Context mode.
Others	Reserved			
5:0	Reserved

Name: Page Directory Pointer Descriptor - PDP0/PML4/PASID

ShortName: PDP0_VECSUNIT3

PDP0/PML4/PASID: This register can contain three values which depend on the element descriptor definition.

PASID[19:0]: Populated in the first 20bits of the register and selected when Advanced Context flag is set in the element descriptor in execlist mode of submission. This is not valid in ring buffer mode of scheduling.

PML4[38:12]: Pointer to base address of PML4 and selected when Legacy Context flag is set and 64b address support is selected. **PDP0[38:12]:** Pointer to one of the four page directory pointer (lowest) and defines the first 0-1GB of memory mapping. This is valid when Legacy Context Flag is set and 64bit virtual addressing is not supported. *Note: This is a guest physical address.*

Programming Notes

Execlist Based Scheduling: SW should update PDP0/12/3 registers in context image with proper values before submitting the context to HW in execlist mode of scheduling. HW restores these registers as part of context restore to set the PPGTT access accordingly. PPGTT is always enabled in advanced context mode of execlist based scheduling and can be disabled only in legacy context mode. Privilege Access Bit in Element Descriptor controls the PPGTT enabling in legacy context mode.

Ring Buffer Based Scheduling: A write via MMIO to PDP0_DESCRIPTOR (lower Dword) triggers the Page Directory Restore in HW when PPGTT is enabled. SW should ensure PDP1/2/3 registers are programmed appropriately prior to programming PDP0. PDP0_DESCRIPTOR lower dword should be programmed at the end. Per-Process GTT Enable Bit in GFX_MODE register controls the PPGTT enabling and disabling. Programming Per-Process GTT Enable Bit in GFX_MODE register doesn't enable/disable the PPGTT translation of memory access immediately; the change comes in to affect only when the Page Directory registers are programmed. Programming Per-Process GTT Enable Bit in GFX_MODE register bit must be followed by programming Page Directory Registers in order to enable or disable the PPGTT translation of memory access. PDP*_DESCRIPTOR registers must always be programmed through MI_LOAD_REGISTER_IMMEDIATE command in ring buffer with

PDP0 - Page Directory Pointer Descriptor - PDP0/PML4/PASID

PDP0_DESCRIPTOR lower dword written at the end. PDP0/12/3 registers are context save restored. PDP descriptors are context save restored per render context in RCS and must be programmed following MI_SET_CONTEXT command, in case of PDP descriptors programmed without context set (MI_SET_CONTEXT) will get lost on C6 entry/exit. PDP descriptors are context save restored in VCS, BCS and VECS engines and must be programmed following setup of CCID register, in case of PDP descriptors programmed without CCID set will get lost on C6 entry/exit. PDP descriptor registers should be programmed after ensuring the pipe is completely flushed and TLB's invalidated.

<p>These are the precision palette entries used for the 10 bpc, split, and 12 bpc gamma. The Precision Palette Index Value indicates the precision palette location to be accessed through this register.</p>		
Programming Notes		
<p>For 10 bpc, program with the color 10 bit palette entry fraction value. For 12 bpc gamma odd indexes, program with the upper 10 bits of the color palette entry fraction value. For 12 bpc gamma even indexes, program the MSBs with the lower 6 bits of the color palette entry fraction value, then program all 0s in the LSbs. For split gamma indexes 0 to 511, program with the first gamma (before CSC) color 10 bit palette entry fraction value. For split gamma indexes 512 to 1023, program with the second gamma (after CSC) color 10 bit palette entry fraction value.</p>		
Restriction		
<p>This register must be written only as a full 32 bit dword. Byte or word writes are not supported.</p>		
DWord	Bit	Description
0	31:30	Reserved
	29:20	Red Precision Palette Entry

9:0	Index Value									

PAL_PREC_INDEX

This field indicates the data location to be accessed through the data register. This value can be automatically incremented by a read or a write to the data register if the index auto increment bit is set. When automatically incrementing, the current automatically calculated index value can be read here, and the index will roll over to 0 after reaching the end of the allowed range.

PIPE_SCANLINE

This is an indication of the current display scan line.

Programming Notes

The line count value is from the display output timing generator, representing the scan line currently being output to a receiver. Due to buffering within the display engine, the line being fetched (read) from the frame buffer is not directly linked to the line being output. It is possible for the fetched line to be hundreds of lines ahead of the timing generator output line.

PIPE_SCANLINECOMP

PIPE_SCANLINECOMP	
Register Space:	MMIO: 0/2/0
Source:	BSpec
Access:	R/W
Size (in bits):	32
Address:	70004h-70007h
Name:	Pipe Scan Line Compare
ShortName:	PIPE_SCANLINECOMP_A
Power:	PG1
Reset:	soft
Address:	71004h-71007h
Name:	Pipe Scan Line Compare
ShortName:	PIPE_SCANLINECOMP_B
Power:	PG2
Reset:	soft
Address:	72004h-72007h
Name:	Pipe Scan Line Compare
ShortName:	PIPE_SCANLINECOMP_C
Power:	PG2
Reset:	soft
<p>This register is used to initiate a display scan line compare. This MMIO driven scan line compare can not be used at the same time as the command streamer driven scan line compare on the same pipe. When this register is written with the Initiate Compare bit set to 1b, the Display Engine (DE) will start comparing the display pipe or plane (selectable) current scan line value (current scan line) with the start scan line value (current scan line \geq start scan line) and the end scan line value (current scan line \leq end scan line) to decide if the pipe scan line is inside or outside the scan line window of interest. DE will wait until the current scan line is either outside (Inclusive mode) or inside (Exclusive mode) the scan line window, then trigger a scan line event and stop any further comparing. The scan line event can cause display to send a scan line compare response to the command streamer, (used for releasing a MI_WAIT_FOR_EVENT on scan line window), if unmasked in the DERRMR mask register 0x44050. The scan line event can also cause display to generate a scan line compare interrupt, if the interrupt registers are configured for that. The value programmed should be the desired value - 1, so for scan line 0, the value programmed is vertical total, and for scan line 1, the value programmed is 0. The programmable range can include the vertical blank. In interlaced display timings, the current scan line is the current line of the current interlaced field. Either MMIO or a MI_LOAD_REGISTER_IMM command can be used to unmask the scan line render response 0x44050. That can be done anytime before programming this register. There is one instance of this register per pipe.</p>	

PIPE_SCANLINECOMP

Restriction

A new scan line compare must not be started until after the previous compare has finished. The end scan line value must be greater than or equal to the start scan line value. When using LRI care must be taken to follow all the programming rules for LRI targetting the display engine.

DWord	Bit	Description									
0	31	Initiate Compare This field initiates the scan line compare. When this register is written with this bit set to 1b, the display engine will do one complete comparison cycle, trigger a scan line event, then stop comparing.									
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td>Do nothing</td> </tr> <tr> <td style="text-align: center;">1b</td> <td>Initiate compare</td> </tr> </tbody> </table>	Value	Name	0b	Do nothing	1b	Initiate compare			
		Value	Name								
		0b	Do nothing								
1b	Initiate compare										
Restriction											
Do not write this register again until after any previous scan line compare has completed.											
30		Inclusive Exclusive Select This field selects whether the scan line compare is done in inclusive mode, where display triggers the scan line event when outside the scan line window, or inclusive mode, where display triggers when inside the window.									
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Exclusive</td> <td>Exclusive mode: trigger scan line event when inside the scan line window</td> </tr> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Inclusive</td> <td>Inclusive mode: trigger scan line event when outside the scan line window</td> </tr> </tbody> </table>	Value	Name	Description	0b	Exclusive	Exclusive mode: trigger scan line event when inside the scan line window	1b	Inclusive	Inclusive mode: trigger scan line event when outside the scan line window
		Value	Name	Description							
		0b	Exclusive	Exclusive mode: trigger scan line event when inside the scan line window							
1b	Inclusive	Inclusive mode: trigger scan line event when outside the scan line window									
Restriction											
Do not write this register again until after any previous scan line compare has completed.											
29		Counter Select This field selects whether the scan line compare is done using the pipe timing generator scanline counter or a plane scanline counter. The pipe timing generator counts the scanlines being output from display. The plane counts the scan lines being fetched from the frame buffer.									
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Timing generator</td> <td>Use the scanline count from the pipe timing generator</td> </tr> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Plane 1</td> <td>Use the scanline count from plane 1</td> </tr> </tbody> </table>	Value	Name	Description	0b	Timing generator	Use the scanline count from the pipe timing generator	1b	Plane 1	Use the scanline count from plane 1
		Value	Name	Description							
		0b	Timing generator	Use the scanline count from the pipe timing generator							
1b	Plane 1	Use the scanline count from plane 1									
Programming Notes											
Due to buffering within the display engine, the line being fetched from the frame buffer is not directly linked to the line being output. It is possible for the fetched line to be hundreds of lines ahead of the timing generator output line. The plane scan line count more closely represents what data is currently being fetched by the plane.											
28:16		Start Scan Line This field specifies the starting scan line number of the scan line window.									
15		Render Response Destination This bit indicates what destination to send the scan line event render response to.									

PIPE_SCANLINECOMP				
		Value	Name	Description
		0b	CS	Send scan line event response to CS
		1b	BCS	Send scan line event response to BCS
	14:13	Reserved		
	12:0	End Scan Line This field specifies the ending scan line number of the scan line window.		

PIPE_SEAM_EXCESS

PIPE_SEAM_EXCESS - PIPE_SEAM_EXCESS	
Register Space:	MMIO: 0/2/0

Power:	PG2
Reset:	soft
<p>This register defines the number of excess pixels within the Pipe window (on the right or left) that the Scaler will need to remove from the post scaled image.</p> <p>When an image is split across two Pipes, scaled, and then joined at the Port, the Scalers within each Pipe will operate on a splitimage that contains overlap pixels around where the final seam will be to facilitate a seamless join at the Port. For example, if the left portion of an image is being scaled in Pipe A and the right portion of the image is being scaled in Pipe B, then there will be an excess number of pixels (i.e. overlap pixels) on the right side of the Pipe A image and an excess number of pixels on the left side of the Pipe B image. The overlap pixels of the window within each of the Pipes need to be dropped by the Scaler before they are delivered to the Port.</p> <p>Notes:</p>	

PIPE_SEAM_EXCESS - PIPE_SEAM_EXCESS

1. Dropping of the overlap/excess pixels is done at the very end of the Pipe within the Scaler regardless of whether a Scaler is bound to the Pipe, or not.
2. The values programmed within this register are one-based (i.e. a programming of 1 equals 1 pixel of excess)
3. The values programmed within this register will be added to the Horizontal Active programming of the TRANS_HTOTAL register of the port bound to this pipe. I.e. the pipe will see a Horizontal size equal to Horizontal Active + Left Excess Amount + Right Excess Amount

Restriction :

1. The number of excess pixels cannot exceed the size of the horizontal blank, otherwise there will not be enough time to throw them away before starting the next line and the image will be corrupted
2. Pillarbox borders must be even
3. The source size on each pipe, including pre-scale excess, must be a multiple of 2. When the Pipe output format is YUV 420 with full blend, the source size is required to be a multiple of 4.

PLANE_COLOR_CTL

		This bit controls plane internal post-CSC gamma correction.	
	Value	Name	
	1b	Disable	
	0b	Enable	
12	Plane Gamma Mode		
	This field specifies the plane gamma mode of operation. This field is ignored if plane gamma is disabled.		
	Value	Name	Description
	0b	Direct [Default]	Direct mode is used for regular plane gamma programming. Lookup is based on incoming pixel individual r, g, b values. The output is a computed by lookup of two nearest points and interpolation.
	1b	Multiply	Multiple mode is used when plane gamma is used for HDR tone mapping. Lookup is based on a pseudo luminance of the incoming pixel calculated using $Lin = 0.25 * \text{Red input} + 0.625 * \text{Green input} + 0.125 * \text{Blue input}$. An adjustment factor 'F' is computed by lookup of two nearest points and interpolation. Output is computed by multiplying each color channel with the adjustment factor F.
11:6	Reserved		
	Format:	MBZ	
5:4	Alpha Mode		
		Description	
	This field controls how the plane will use per pixel alpha data from frame buffer. Constant plane alpha is defined in PLANE_KEYMSK and PLANE_KEYMAX registers.		
	RGB 64-bit - only alpha in 0-1 range supported with 8 bit granularity.		
	RGB 64-bit UINT - only 8 upper bits of alpha used.		
	RGB 2:10:10:10 - 2 bit alpha expanded out to 8 bit to give full range of opacity.		
	XR_BIAS 10:10:10 - 2 bit alpha expanded out to 8 bit to give full range of opacity.		
	Value	Name	Description
	00b	Disable	Alpha channel ignored.
	10b	Enable with SW pre-multiply	Alpha channel used. Color channels should be pre-multiplied with alpha by software.
	11b	Enable with HW pre-multiply	Alpha channel used. Color channels will be pre-multiplied with alpha by hardware.
	Restriction		

PLANE_COLOR_CTL

Per pixel alpha is supported only with RGB pixel formats. FBC is not compatible with per pixel alpha.		
3:0	Reserved

The post-offset is intended to add an offset from 0 on the Y or RGB channels and to convert UV channels from 2's complement to excess 0.5 as they exit plane color space conversion (CSC).

DWord	Bit	Description
0	31:13	Reserved Format: MBZ
	12:0	PostCSC High Offset This value is used to give an offset to the high color channel as it exits CSC logic. The value is a

PLANE_CSC_POSTOFF		
		2's complement fraction allowing offsets between -1 and +1 (exclusive).
1	31:13	Reserved Format: MBZ
	12:0	PostCSC Medium Offset This value is used to give an offset to the medium color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).
2	31:13	Reserved Format: MBZ
	12:0	PostCSC Low Offset This value is used to give an offset to the low color channel as it exits CSC logic. The value is a 2's complement fraction allowing offsets between -1 and +1 (exclusive).

The pipe scaler can be attached to a plane to scale the plane output before blending.

Restriction

Refer to 'Plane Capability and Interoperability' page for plane capabilities and restrictions.

DWord	Bit	Description						
0	31	<p>Plane Enable When this bit is set, the plane will generate pixels for display. When cleared to zero, plane memory fetches cease and plane output is transparent.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Disable</td> </tr> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Enable</td> </tr> </tbody> </table>	Value	Name	0b	Disable	1b	Enable
Value	Name							
0b	Disable							
1b	Enable							
	30:28	<p>Pipe Slice Arbitration Slots</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; height: 20px;"></td> <td style="width: 50%;"></td> </tr> </table> <p>This field specifies the number of slots allocated to this plane in pipe slice request arbitration. This field is ignored when the 'PIPE_SLICE_ARBITRATION_CTL->Use Programmed Slots' is not set. This field is zero based; a programmed value of 0 results in 1 slot allocation.</p>						
	27:23	<p>Source Pixel Format</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; height: 20px;"></td> <td style="width: 50%;"></td> </tr> </table> <p>This field selects the source pixel format for the plane. Before entering the blender, each source format is converted to the pipe pixel format. The 8-bpp indexed format will always use the pipe palette. In planar YUV formats Y samples appear first in memory followed by interleaved UV samples. YUV 4:2:2 byte order is programmed separately. YUV 4:2:0 and YUV 4:4:4 byte order is not programmable. RGB color order is programmed separately for some formats. Refer to Universal Plane, Plane Pixel Formats section for color channel bit mappings.</p> <p>YUV 4:2:0 P010, P012 and P016 formats share the same 16 bpc memory layout but use 10, 12 and 16 bits per channel respectively. The color values are stored in the most significant bits.</p>						

PLANE_CTL

64-bit formats supported only on the HDR planes.
P01x output is only allowed from HDR planes.

Value	Name	Description
00000b	YUV 422 Packed 8 bpc	YUV 4:2:2 packed, 8 bpc

Restriction

Plane scaling is not compatible with the Indexed 8-bit, XR_BIAS source pixel formats.

22:21 Key Enable

This field enables color keying. The key color, range, channel enables, and mask are programmed in PLANE_KEYVAL, PLANE_KEYMSK, and PLANE_KEYMAX.

Value	Name	Description
00b	Disable	Disable keying for this plane.
01b	Source Key Enable	This plane's pixels will be checked for a key match. The blend between this plane and the plane below will treat the key matched pixels as transparent.
10b	Destination Key Enable	This plane's pixels will be checked for a key match. The blend between this plane and the plane above will treat the pixels above as opaque only where this plane is key matched and the plane above is opaque. When plane gamma is enabled, the gamma processing may shift the pixel color values sent to blender and may cause it to not match the

PLANE_CTL

			key color as desired. The recommendation is to use the pipe gamma when destination keying is enabled.
	11b	Source Key Window Enable	This plane's pixels will be checked for a key match. The blend between this plane and the plane below will treat the key matched pixels as transparent only where the plane below is opaque.
Restriction			
Plane color keying is not compatible with the Indexed 8-bit pixel format. Destination key/Source Key Window should be enabled only on one set (a pair) of planes, per pipe, at a time. Source key and Source Key Window must not be enabled on the bottom most active plane. Destination key must not be enabled on the top most active plane.			
20	RGB Color Order This field is used to select the color order when using RGB data formats, except RGB 32-bit XR_BIAS 10:10:10 and 16-bit BGRX 5:6:5. For other formats, this field is ignored.		
	Value	Name	Description
	0b	BGRX	BGRX (MSB-X:R:G:B)
	1b	RGBX	RGBX (MSB-X:B:G:R)
19	Planar YUV420 component		
	This field selects the planar YUV420 component for the plane when NV12/P0xx source pixel formats is used. This field must be set to '0b' for other (YUV non-planar/RGB) surface formats.		
	Value	Name	Description
	0b	UV	Planes 1 to 5 can be configured as UV plane. Planes 6 and 7 must not be configured as a UV plane.
	1b	Y	Planes 6 and 7 can be configured as Y plane. Planes 1 to 5 must not be configured as a Y plane.
18	Reserved		
	Format:		MBZ
17:16	YUV 422 Byte Order This field is used to select the byte order for YUV 4:2:2 data formats. For other formats, this field is ignored.		
	Value	Name	Description
	00b	YUYV	YUYV (MSB-V:Y2:U:Y1)
	01b	UYVY	UYVY (MSB-Y2:V:Y1:U)
	10b	YVYU	YVYU (MSB-U:Y2:V:Y1)

Description

This register programs the chroma upsampler for processing pixel streams from hybrid planar YUV 420 (NV12, P0xx) surfaces.

This dedicated chroma upsampling capability is available only in Planes 1 through 3. Planes 4 and 5 must use plane scaler (PS_CTRL) for chroma upsampling.

The following table shows phase programming for frequently used YUV420 to YUV444 chroma upsampling scenarios.

YUV 420 Chroma Siting	Horz Phase	Vert Phase	Programmed Horz Initial Phase	Programmed Horz Initial Phase Sign	Programmed Vert Initial Phase	Programmed Vert Initial Phase Sign
Top Left	0	0	0	0	0	0
Top	-0.25	0	0.25	1	0	0
Left (MPEG-2)	0	-0.25	0	0	0.25	1
Center (MPEG-1)	-0.25	-0.25	0.25	1	0.25	1

Restriction :
 When the Chroma upsampler is enabled, then:

PLANE_CUS_CTL

1. The maximum horizontal plane size allowed is 4096 pixels
2. The minimum horizontal plane size allowed is 8 pixels
3. The minimum vertical plane size allowed is 4 lines
4. The horizontal and vertical plane size should be even

Key Max Value fields: When plane source is YUV, this register specifies the maximum YUV key value to be used together with the minimum YUV key value and the channel enables to determine if the plane matches the key. When plane source is RGB, these fields are not used.

DWord	Bit	Description
0	31:24	Plane Alpha Value Specifies the plane alpha value when plane alpha is enabled in PLANE_KEYMSK register.
	23:16	V Key Max Value Specifies the maximum key value for the V channel.
	15:8	Y Key Max Value Specifies the maximum key value for the Y channel.
	7:0	U Key Max Value Specifies the maximum key value for the U channel.

DWord	Bit	Description	
0	31	Plane Alpha Enable	
		Description	
		Enables the plane alpha. Color channels will be pre-multiplied by hardware with the plane alpha value from PLANE_KEYMAX register. Per-pixel alpha is defined in the PLANE_COLOR_CTL register.	
		Value	Name
	0b	Disable	
	1b	Enable	
	30:27	Reserved	
	Format:		MBZ
	26	V or R Key Channel Enable	
		Enables the V/Red channel for key comparison. A disabled channel will be ignored when determining a key match.	
Value		Name	
0b		Disable	
25	Y or G Key Channel Enable		
	Enables the Y/Green channel for key comparison. A disabled channel will be ignored when determining a key match.		
	Value	Name	
	0b	Disable	
24	U or B Key Channel Enable		
	Enables the U/Blue channel for key comparison. A disabled channel will be ignored when determining a key match.		
	Value	Name	

PLANE_KEYMSK

		0b	Disable
		1b	Enable
23:16	R Key Mask Value Specifies the key mask for the Red channel. A zero bit in the mask indicates that the corresponding bit will be ignored when determining a key match.		
15:8	G Key Mask Value Specifies the key mask for the Green channel. A zero bit in the mask indicates that the corresponding bit will be ignored when determining a key match.		
7:0	B Key Mask Value Specifies the key mask for the Blue channel. A zero bit in the mask indicates that the corresponding bit will be ignored when determining a key match.

When plane source is YUV, this register specifies the minimum YUV key value to be used together with the maximum YUV key value and the channel enables to determine if the plane matches the key. When plane source is RGB, this register specifies the RGB key value to be used together with the channel masks to determine if the plane matches the key. RGB key matches can only occur for positive pixel values in the 0 to 1 range. Extended range pixel values will not match. MSB bits are used for comparison.

This register specifies the panning for the plane surface. The start position is specified in this register as a (x, y) offset from the beginning of the surface. When performing 180 rotation, hardware will internally add the plane size to the offsets so the plane will start displaying from the bottom right corner of the image. When performing 90 rotation, the offset programmed should take the rotation in to consideration. X offset = (Surface height in tiles * tile height) - Y offset - Y Size, Y offset = X offset When performing 270 rotation, use the same programming as 90 rotation. For YUV planar format non-rotate cases, the UV surface offsets should be half of the Y surface offsets when the UV surface is tile row aligned. When the UV surface is not tile row aligned, the UV surface Y offset should also include the lines from the previous nearest tile row aligned address.

Restriction

The plane size + offset must not exceed the maximum supported plane size.

This register specifies the screen position of the plane. The origin of the plane position is always the upper left corner of the display pipe source image area. When plane scaling is not enabled on this plane, this is the position of the plane when blended with other planes on this pipe. When plane scaling is enabled on this plane, the scaler window position is the position of the plane when blended with other planes on this pipe. When performing rotation, the plane image is rotated by hardware, but the position is not, so it must be adjusted if it is desired to maintain the same apparent position on a physically rotated display.

Restriction

When plane scaling is not enabled on this plane, the plane must be completely contained within the pipe source area. Pipe source size \geq plane position + plane size. When plane scaling is enabled on this plane, the X and Y positions must be programmed to 0.

DWord	Bit	Description
0	31:29	Reserved
		Format: MBZ

PLANE_POST_CSC_GAMC_INDEX and PLANE_POST_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.

The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.

For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 24 bits per color in an unsigned 0.24 format with 0 integer and 24 fractional. The 33rd, 34th and 35th entries are stored as 27 bits per color in an unsigned 3.24 format with 3 integer and 24 fractional bits.

For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate

PLANE_POST_CSC_GAMC_DATA_ENH

between the 33rd and 34th gamma entries to create the result value.

For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.

For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.

Pre-CSC Gamma correction gets enabled or disabled based on the "Pipe CSC Enable" bit in the plane control register. The same set of values is used for gamma correction of the red, blue and green channels.

See Pipe Gamma for an example gamma curve diagram.

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

For HDR tone mapping usages, only the first 33 entries gets used. The entries are used either in an unsigned 0.24 format or unsigned 8.16 format based on PLANE_COLOR_CTL->Plane Gamma Multiplier Precision programming.

Restriction

The gamma curve must be flat or increasing, never decreasing when used in the direct lookup mode. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

<p>PLANE_POST_CSC_GAMC_INDEX and PLANE_POST_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data after plane Color Space Conversion.</p> <p>The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.</p> <p>For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.</p> <p>For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.</p> <p>For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.</p> <p>For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.</p> <p>Plane Post-CSC Gamma correction gets enabled or disabled based on the 'Plane Gamma Disable' bit in the 'PLANE_COLOR_CTL' register. The same set of values is used for gamma correction of the red, blue and green channels.</p>	
Programming Notes	
<p>To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.</p>	
Restriction	
<p>The gamma curve must be flat or increasing, never decreasing in Direct mode. The gamma correction registers</p>	

PLANE_POST_CSC_GAMC_DATA

should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

<p>PLANE_PRE_CSC_GAMC_INDEX and PLANE_PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.</p> <p>The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.</p> <p>For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 129 gamma entries to create the result value. The first 128 entries are stored as 24 bits per color in an unsigned 0.24 format with 0 integer and 24 fractional. The 129th, 130th and 131th entries are stored as 27 bits per color in an unsigned 3.24 format with 3 integer and 24 fractional bits.</p> <p>For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate</p>	

PLANE_PRE_CSC_GAMC_DATA_ENH

between the 129th and 130th gamma entries to create the result value.
 For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 130th and 131st gamma entries to create the result value.
 For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.
 Pre-CSC Gamma correction gets enabled or disabled based on the "Plane Pre CSC Gamma Enable" bit in the plane color control register. The same set of values is used for gamma correction of the red, blue and green channels.
 See Pipe Gamma for an example gamma curve diagram.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 128 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 129th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 130th gamma entry.

Restriction

The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

PLANE_PRE_CSC_GAMC_INDEX and PLANE_PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the plane pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion, if needed.

The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.

For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.

For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.

For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.

For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.

Plane Pre-CSC Gamma correction gets enabled or disabled based on the 'Plane Pre CSC Gamma Enable' bit in the 'PLANE_COLOR_CTL' register. The same set of values is used for gamma correction of the red, blue and green channels.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

Restriction

The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be

PLANE_PRE_CSC_GAMC_DATA

updated when the plane is off, otherwise screen artifacts may show temporarily.

This register specifies the plane source size, the size of the image fetched from the frame buffer. When plane scaling is not enabled on this plane, this is the size of the plane when blended with other planes on this pipe. When plane scaling is enabled on this plane, the scaler window size is the size of the plane when blended with other planes on this pipe.

Restriction

When plane scaling is not enabled on this plane, the plane must be completely contained within the pipe source area. Pipe source size \geq plane position + plane size.

For OLED compensation plane size restrictions, refer to PIPE_MISC->OLED Compensation (bit[12]).

Height and Width restrictions are specified in the following table. For formats not specified in the table, both odd and even sizes are supported.

PixelFormat	Rotate	Width	Height
YUV 420 Planar - NV12	All	Even	Even
YUV 420 Planar - P01x	All	Even	Even
YUV 422	All	Even	Even
RGB565	90, 270	Even	Even

If Plane Scaling or using the Chroma Up-Sampler (CUS) for this plane, please refer to **PS_CTRL** or **PLANE_CUS_CTL** respectively, for further size restrictions.

DWord	Bit	Description
0	31:29	Reserved <div style="border: 1px solid black; height: 15px; width: 100%;"></div> Format: MBZ
	28:16	Height <div style="border: 1px solid black; height: 15px; width: 100%;"></div> This specifies the height of the plane in lines. The value in the register is the height minus one. <div style="border: 1px solid black; background-color: #e6f2ff; padding: 2px; text-align: center; margin-top: 5px;"> Restriction </div> The height must be at least one line when non-interlaced, two lines when interlaced. The

PLANE_SIZE

		height is limited to maximum of 4320 lines. Refer to size restrictions within PS_CTRL when plane scaling is enabled.	
15:13	Reserved		
	Format:	MBZ	
12:0	Width	This specifies the width of the plane in pixels. The value in the register is the width minus one.	
		Restriction	
		The width must be even (programmed value odd) when YUV 4:2:2 or YUV 4:2:0 source pixel format is used. The width must not be 0. The width should be less than or equal to the stride in pixels.	
		For YUV4:2:0(NV12), the UV plane must be greater than or equal to 8 and the Y plane must be greater than or equal to 16. The width must be greater than or equal to 4 for 32bpp formats, greater than or equal to 8 for 16bpp formats, and greater than or equal to 16 for 8bpp formats. The width must be greater than or equal to 2 for 64bpp formats. The width should be less than or equal to the stride in pixels. For planar YUV 420 formats, refer to chroma upsampler size restrictions in PLANE_CUS_CTL register.	
		Tiling format	Bytes per pixel
		Max Width supported in pixels	
	Linear, X Tiling	1,2,4,8	5120
	Y Tiling	1,2,4,8	5120
	Yf Tiling	8	Not supported
		1,2,4	5120

Writes to this register arm primary registers for this pipe. A write to this register is considered a flip and can cause a flip done interrupt if the interrupt registers are configured for that. The values in this register may be updated through MMIO writes or through command streamer initiated flips. Synchronous updates (synchronous command streamer flips or synchronous MMIO writes) will update the plane surface values at the start of the next vertical blank. Asynchronous updates (asynchronous command streamer flips or asynchronous MMIO writes) will update the plane surface values at the next TLB request or at the start of the next vertical blank. Stereo 3D synchronous updates (stereo 3D command streamer flips or synchronous MMIO writes while stereo 3D is enabled) will update at the start of either the left or right eye vertical blank, selectable by the plane control register stereo surface vblank mask.

Double buffering control does not apply to PLANE_SURF updates that occur when the plane is disabled. An interrupt event is generated immediately when the PLANE_SURF is written. If the interrupt is unmasked, the interrupt is logged in the IIR.

Asynchronous flip completion time depends greatly on how much data has been prefetched for power savings, and can take up to 1 full frame to complete. For faster flip completion, disable FBC and render compression and allocate a small amount of data buffer for the plane.

DWord	Bit	Description		
0	31:12	<p>Surface Base Address</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 30%;">Format:</td> <td>GraphicsAddress[31:12]</td> </tr> </table> <p>This address specifies the surface base address bits 31:12. In stereo 3D mode this is the right eye base address. In non-stereo 3D mode this is the only base address. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.</p> <p style="text-align: center;">Restriction</p> <p>The surface base address must be at least 256KB aligned in the Linear or X-tiling modes and must be at least 1MB aligned in the Y-tiling mode. With planar YUV 420 formats, the alignment restrictions apply only for the Y surface.</p> <p>Allocate either an extra 168 Page Table Entries (PTEs) or tile row worth of PTEs beyond the end of the displayed surface. If 180 or 270 plane rotation capability is required, allocate an extra 168 PTEs or a tile row worth of PTEs before the beginning of the surface. When address range limits are reached, wrap around to finish allocating the extra PTEs. Only the PTEs will be used, not the pages themselves. The graphics address of the next usable surface must start after the padding. All the extra entries shall map to the same dummy page.</p>	Format:	GraphicsAddress[31:12]

Programming Notes

There are eight regular watermarks and a transition watermark per plane/cursor. For YUV planar source formats, only the Y surface watermark value should be programmed. Watermark programming instructions are documented separately.

Restriction

For minimum watermark requirements refer to Display Watermark Programming section.

DWord	Bit	Description						
0	31	<p>Enable This field enables this watermark. All the watermarks at this level for all enabled planes must be enabled before the level will be used.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Enable</td> </tr> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Disable</td> </tr> </tbody> </table>	Value	Name	1b	Enable	0b	Disable

<p>Display Driver writes to these bits to tell FIA hardware which Main Links of the Display Port are enabled on Type-C Connector 0. FIA hardware uses this information for PHY to Controller signal mapping.</p> <p>For example, in DP Pin Assignment C, the register DFLEXDPSP1.DPX4TXLATC0 tells Display Driver that all the 4 TX Lanes in PHY can be used. However, Display Driver may choose to use only x1, i.e. for ML0. Then Display Driver will program "0001b" to this register. For x2 and x4, Display Driver will program "0011b" and "1111b", respectively.</p> <p>In the case of "No pin assignment" (fixed or static DP connection in MG PHY programming page), if display driver chooses to use only x2 with no lane reversal, then display driver will program "0011" to this register. If display driver chooses to use only x2 with lane reversal, then display driver will program "1100" to this register. If display driver chooses to use only x1 with no lane reversal, then display driver will program "0001" to this register. If display driver chooses to use only x1 with lane reversal, then display driver will program "1000" to this register.</p> <p>Display Driver is expected to write to this register when the DDI Interface between DP Controller and FIA is in the Safe Mode, e.g. pllen=pwrreq=lane_enable=0. Display Driver writes to this register and then only it brings up the DP Controller, i.e. to bring the DDI interface out from Safe Mode.</p> <p>A mode set is required to switch the number of DP lanes.</p> <p>This register is applicable in both Type-C connector's Alternate mode and also DP connector mode.</p>

		Value	Name
		0001b	ML0
		0011b	ML[1:0]
		1100b	ML[3:2]
		1111b	ML[3:0]
3:0	<p>Displayport Main Link Enable for Type-C Connector 0</p> <p>Display Port Main Link Enable for Type-C Connector 0 (DPMLETC0): 4 bits correspond to 4 Main Link in DP Controller. Bit [0] is ML0, bit [1] is ML1 and so on. The Type-C Connector number is logical number. It's not physical lane numbers. Refer to the SOC block diagram for the mapping of Type-C Connector number to the actual physical lane number of the PHY. Display Driver writes to these bits to tell FIA hardware which Main Links of the Display Port are enabled on Type-C Connector 0. FIA hardware use this information for PHY to Controller signal mapping. For example, in DP Pin Assignment C, the register DFLEXDPSP1.DPX4TXLATC0 tells Display Driver that all the 4 TX Lane in PHY can be used. However, Display Driver may choose to use only x1, i.e. for ML0. Then Display Driver will program "0001b" to this register. For x2 and x4, Display Driver will program "0011b" and "1111b", respectively.</p>

Dynamic FlexIO DP Scratch Pad (Type-C) There are up to 4 instances of this register per FIA. DFLEXDPSP1 supports connectors 0-3 (logical number). DFLEXDPSP2 supports connectors 4-7 (logical number).	

PORT_TX_DFLEXDPSP - PORT_TX_DFLEXDPSP

DFLEXDPSP3 supports connectors 8-11 (logical number).
 DFLEXDPSP4 supports connectors 12-15 (logical number).
 The connector number specified in these fields is relative to the connector supported by this register instance.
 ie. DFLEXDPSP2 field Display Port x4 TX Lane Assignment for Type-C Connector 0 is referring to connector 4
 (logical number), and DFLEXDPSP4 field Display Port x4 TX Lane Assignment for Type-C Connector 3 is referring
 to connector 15 (local number).

When module FIA is enabled i.e., PORT_TX_DFLEXDPSP[MF] = 1,
 Ports 1 and 2 live state would be reported to FIA0.DFLEXDPSP1 (bits 5, 6, 13, 14) from FIA0.
 Ports 3 and 4 live state would be reported to FIA1.DFLEXDPSP1(bits 5, 6, 13, 14) from FIA1.

This register contains the LRCA address for the POSH pipe to which POCS does context save/restore. LRCA address programmed in this register is only effective when "POSH Enable" field is set in CTX_SR_CTL register. This register is not functional and must not be programmed for VideoCS, VideoEnhancementCS, BlitterCS.

<p>This register contains the mode selection for configuring render engine to attain desired performance and power requirements for a given context. This register is render context save/restored. This register must be initialized correctly when the context is submitted for the first time. This register is context save/restored as part of Exec-List context image in both Exec-List and Ring-Buffer mode of scheduling. This register contents are valid only when "Enable" bit [31] of the register is set.</p>		
Programming Notes		
<p>This register is only functional for RenderCS. This register must not be exercised in VideoCS, BlitterCS and VideoEnhancementCS.</p>		
<p>This register must not be programmed directly through CPU MMIO cycle.</p> <p>Exec-List Scheduling Mode: Every context can have its own required render engine configuration by programming this register appropriately in the logical render context image in memory (LRCA) before submitting the context to the execlist submit port. This register must not be programmed using MI_LOAD_REGISTER_IMM command in ring buffer or in batch buffer.</p>

Reset:	soft
Address:	4B488h-4B48Bh
Name:	Pipe Pre CSC Gamma Data
ShortName:	PRE_CSC_GAMC_DATA_C
Power:	PG2
Reset:	soft
Description	
<p>PRE_CSC_GAMC_INDEX and PRE_CSC_GAMC_DATA registers are used to program the values that determine the characteristics of the gamma correction for the pipe pixel data before Color Space Conversion. Additional gamma correction can be done after the Color Space Conversion Gamma if desired.</p> <p>The gamma correction curve is represented by specifying a set of gamma entry reference points spaced equally along the curve for values between -1 and 1. For extended values there are extended gamma entry reference points. All input values are clamped to the greater than -7.0 and less than 7.0 range before the gamma calculation.</p> <p>For input values greater than or equal to 0 and less than 1.0, the input value is used to linearly interpolate between two adjacent points of the first 33 gamma entries to create the result value. The first 32 entries are stored as 16 bits per color in an unsigned 0.16 format with 0 integer and 16 fractional. The 33rd, 34th and 35th entries are stored as 19 bits per color in an unsigned 3.16 format with 3 integer and 16 fractional bits.</p>	

PRE_CSC_GAMC_DATA

For input values greater than or equal to 1.0 and less than 3.0, the input value is used to linearly interpolate between the 33rd and 34th gamma entries to create the result value.

For input values greater than or equal to 3.0 and less than 7.0, the input value is used to linearly interpolate between the 34th and 35th gamma entries to create the result value.

For negative input values, gamma is mirrored along the X-axis, giving the same result as positive input values, except for a negative sign. When gamma input may be negative, the first gamma point should be programmed to a value of 0.0 in order to have a symmetric mirroring.

Pre-CSC Gamma correction gets enabled or disabled based on the "Pipe CSC Enable" bit in the PLANE_COLOR_CTL register. The same set of values is used for gamma correction of the red, blue and green channels.

See Pipe Gamma for an example gamma curve diagram.

Programming Notes

To program the gamma correction entries, calculate the desired gamma curve for inputs from 0 to 7.0. For inputs of 0 to 1.0, multiply the input value by 32 to find the gamma entry number, then store the desired gamma result in that entry. For inputs greater than 1.0 and less than or equal to 3.0, store the result for an input of 3.0 in the 34th gamma entry. For inputs greater than 3.0 and less than or equal to 7.0, store the result for an input of 7.0 in the 35th gamma entry.

Restriction

The gamma curve must be flat or increasing, never decreasing. The gamma correction registers should only be updated when the plane is off, otherwise screen artifacts may show temporarily.

Programming Notes

Programming Restriction:

Ring Buffer Mode Of Scheduling: This register must NEVER be programmed in functional mode, this should be used only in validation mode to achieve deterministic behavior of UHPTR being sampled by a given MI_ARB_CHECK in command stream. Programmer has to ensure that RCS Preemption Hint register gets programmed before UHPTR is programmed and well before RCS crosses the corresponding execution point. Preemption hint for both RingBuffer and Batch Buffer can't be enabled simultaneously.

This register must NEVER be programmed in functional mode, this should be used only in validation mode to achieve deterministic behavior of preemption to match behavioral functional models.

User must ensure the Preempted Hint Address programmed matches either Ring Head Offset or Batch Buffer Graphics Virtual Address and not both of them.

User must also ensure the Preempted Hint Address[19:0] programmed matches either Ring Head Offset[19:0] or Batch Buffer Graphics Virtual Address[19:0] and not both of them.

These are the coefficient values for scaler.
 The scaler coefficient Index indicates the coefficients array location to be accessed through this register.
 The contents of the coefficient array is uninitialized until Software loads the array (i.e. the array is not resettable).
 Use of the coefficient array or reading from the coefficient array before Software has initialized it will result in non-deterministic behavior or read back data.

Restriction

This register must be written only as a full 32 bit dword. Byte or word writes are not supported.

DWord	Bit	Description
0	31:16	Coefficient2 Format: SCALER_COEFFICIENT_FORMAT Specifies the value for the second coefficient stored in this dword.
	15:0	Coefficient1 Format: SCALER_COEFFICIENT_FORMAT Specifies the value for the first coefficient stored in this dword.

Description

The pipe scalers are used to scale the output of a display pipe or of a display plane. All pipes have two scalers each.

The scaler preserves 8 bits of alpha and 10 bits of each color channel for plane scaling and 12 bits of each color channel for pipe scaling.

The scalers can be assigned to any plane (except cursor) output or the output of the display pipe (after blending and color correction, before dithering and color clamping).

Downscale usages have scale factor restrictions:

- All scaler modes support a downscale factor of less than 3.0 in each direction.
- Pipe YUV 420 encoding for port output supports Y downscale factor of less than 1.5 in each direction.

The scalers support horizontal source sizes up to 5120 and vertical source sizes up to 4096.

Programming Notes

The scalers must not be enabled when the horizontal source sizes are greater than 5120 and the vertical sizes greater than 4320.

Driver is responsible for making sure all the plane, pipe, and scaler size registers are programmed appropriately and gets applied atomically to the same frame since hardware does not ensure an atomic update of plane, scaler, and pipe source size registers.

When scaling a pipe, the scaler window size and position must fit within the pipe active size. If there is a seam present (i.e. PIPE_SEAM_EXCESS is non-zero), then the pipe's horizontal active size that the scaler sees is the horizontal active size defined within the TRANS_HTOTAL register plus the amount(s) specified within the PIPE_SEAM_EXCESS.

Pipe Horizontal Active = Horizontal Active + Left Excess Amount + Right Excess Amount

Refer to 'YUV 420 Support' page for scaler restrictions with YUV 420 pipe output.

Restriction

Down scaling (scaler input size is larger than scaler window size) can reduce the maximum supported pixel rate for a pipe as well as increase the watermark and data buffer requirements. Refer to the Display Resolution Support page and Watermark Calculations page for detailed calculations.

Scaler 1 and 2 must not be both scaling the same plane output.

When scaling a pipe, the scaler window size and position must fit within the pipe active size.

When scaling a plane, the plane position must be programmed to 0 and the scaler window size and position must fit within the pipe source size.

When scaling is enabled, the scaler input width should be a minimum of 8 pixels and the height should be minimum of 8 scanlines.

PS_CTRL

When the plane scaling is used with YUV 420 planar formats, the height should be a minimum of 16 scanlines. When using down scaling (scaler input size is larger than scaler output size) the maximum supported pixel rate will be reduced by the down scale amount.

plane blender.

Value	Name
000b	Pipe Scaler
001b	Plane 1 Scaler
010b	Plane 2 Scaler
011b	Plane 3 Scaler
100b	Plane 4 Scaler
101b	Plane 5 Scaler
110b	Plane 6 Scaler
111b	Plane 7 Scaler

Programming Notes

When plane scaling is enabled on planes 1 through 3, make sure that the *PLANE_CUS_CTL.Plane Scaling Enabled* (bit 30) is programmed correctly.

Restriction

The scaler input size should be at least 8 scanlines.
 Plane/Pipe scaling is not compatible with interlaced fetch mode.
 Plane up and down scaling is not compatible with keying. Keying can be enabled with 1:1 plane scaling.
 Plane scaling is not compatible with the Indexed 8-bit, XR_BIAS, or any pixel values less than 0 or greater than 1.

24:23 FILTER SELECT

Description

This field selects filter coefficients. The medium coefficients will provide an unfiltered image when the scale factor is 1:1.

In the programmed mode, the filter coefficients must be programmed using the PS_COEF_INDEX and PS_COEF_DATA registers and the Filter Set Select bits should be programmed.

Value	Name
00b	Medium
01b	Programmed
10b	Edge Enhance
11b	Bilinear

22 ADAPTIVE FILTER SELECT

This field selects the filter coefficients used for adaptive filtering. The field is ignored when adaptive filtering is not enabled.

Each of these fields is a sticky bit that gives the ECC error status for a particular memory bank. A '1' in a bit indicates that ECC detected an error. A write of '1' to a bit will clear the bit. Single errors are corrected by ECC. Double errors are not correctable.

Description

This register programs the scaler horizontal filtering initial phase. The initial phase within the -0.5 to 1.5 range is supported. Refer to PS_VPHASE for programming details. The programming of this register is ignored by the pipe scaler when the pipe is in the Full Blend YUV420 mode. The scaler hardware is responsible for calculating and applying the appropriate horizontal phase when encoding the YUV420 format.

DWord	Bit	Description						
0	31:30	Y Initial HPhase Int This field specifies the integer part of the Y horizontal filtering initial phase when the scaler is operating on YUV420 hybrid planar formats. This field is ignored for non-YUV420 pixel formats.						
	29:17	Y Initial HPhase Frac This field specifies the most significant 13 bits of the fractional part of the Y horizontal filtering initial phase when the scaler is operating on YUV420 hybrid planar formats. This field should be programmed with the fractional portion of the initial phase multiplied by 2^{13} . This field is ignored for non-YUV420 pixel formats.						
	16	Y Initial HPhase Trip This field specifies whether the initial trip, that may occur while applying the initial phase, is used in Y horizontal filtering. This field is ignored for non-YUV420 pixel formats. <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1b</td> <td>Enable</td> </tr> <tr> <td style="text-align: center;">0b</td> <td>Disable</td> </tr> </tbody> </table>	Value	Name	1b	Enable	0b	Disable

Description

This register programs the scaler vertical filtering initial phase. The programming of this register is ignored in the pipe scaler PF/ID fetch mode, and the pipe scaler is responsible for applying the appropriate vertical phase to the proper frame when interlacing.

The initial phase within the -0.5 to 1.5 range is supported.

Programming +ve initial phase:

- Initial Phase Trip = 1b
- Initial Phase Int = Desired Initial Phase Int
- Initial Phase Frac = Desired Initial Phase Frac

Programming -ve initial phase:

- Initial Phase Trip = 0b
- Initial Phase Int = 00b
- Initial Phase Frac = 1 - Desired Initial Phase Frac

For example, -0.25 initial phase should be programmed as

- Initial Phase Trip = 0b
- Initial Phase Int = 00b
- Initial Phase Frac = 1 - 0.25 = 0.75

The following table shows phase programming for frequently used YUV420 to YUV444 chroma upsampling scenarios (chroma being filtered to the center of the pixel).

YUV 420 Chroma Siting	H Phase	V Phase	Programmed H Initial Phase	Programmed H Initial Trip	Programmed V Initial Phase	Programmed V Initial Trip
Top Left	0.25	0.25	0.25	1	0.25	1
Bottom Right (MPEG-1)	-0.25	-0.25	0.75	0	0.75	0
Bottom Center (MPEG-2)	0	-0.25	0	0	0.75	0

The programming of this register is ignored by a pipe scaler when the pipe is in the Full Blend YUV420 mode. The scaler hardware is responsible for calculating and applying the appropriate vertical phase when encoding the YUV420 format.

Coordinates are determined with a value of (0,0) being the upper left corner of the display device (rotation does not affect this).

Restriction

When scaling a pipe, the scaled output must fit inside the pipe active area, so Pipe active size \geq PS window position + PS window size. When scaling a plane, the scaled output must fit inside the pipe source area, so Pipe source size \geq PS window position + PS window size.

PS_WIN_SZ

Name: PS Window Size 1
 ShortName: PS_WIN_SZ_2_C
 Power: PG2
 Reset: soft

This register specifies the size in pixels of the scaled output window. A programmed value of (100, 100) will result in scaled output window of size 100x100 pixels.

Writes to this register arm PS registers on this pipe. After arming, any write to other PS registers will disarm all PS registers. Subsequent write to this register will arm them again.

Restriction

When scaling a pipe, the scaled output must fit inside the pipe active area, so Pipe active size \geq PS window position + PS window size. When scaling a plane, the scaled output must fit inside the pipe source area, so Pipe source size \geq PS window position + PS window size.

DWord	Bit	Description
0	31:30	Reserved
		Format: MBZ
	29:16	XSIZE
		Description
This field specifies the horizontal size in pixels of the scaled output window. Restriction : When the pipe scalar is configured to output YUV 420, the X size must be even.		
15:13	Reserved	
	Format: MBZ	
12:0	12:0	YSIZE
		Description
		This field specifies the vertical size in scan lines of the scaled output window. Restriction : Bit 0 must be zero for interlaced modes.
	Restriction	
		When the pipe scalar is configured to output YUV 420, the Y size must be even.

PS Depth Count

PS_DEPTH_COUNT - PS Depth Count		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	64	
Trusted Type:	1	
Address:	02350h	
<p>This register stores the value of the count of samples that have passed the depth test. This register is part of the context save and restore. Note that the value of this register can be obtained in a pipeline-synchronous fashion without a pipeline flush by using the 3DCONTROL command. See 3D Overview in the 3D volume.</p>		
DWord	Bit	Description
0..1	63:32	Depth Count UDW This register reflects the total number of samples that have passed the depth test (i.e., will be visible). All samples are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Samples that pass the depth test but fail the stencil test will not be counted.
	31:0	Depth Count LDW This register reflects the total number of samples that have passed the depth test (i.e., will be visible). All samples are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Samples that pass the depth test but fail the stencil test will not be counted.

PS Depth Count for Slice0

ShortName:	PS_DEPTH_COUNT_SLICE6	
This register stores the value of the count of pixels that have passed the depth test in Slice6. This register is part of the render context save and restore. This register should not be programmed by SW.		
DWord	Bit	Description
0..1	63:32	Depth Count UDW This register reflects the depth test in slice5 (i.e., will be visible). All pixels are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Pixels that pass the depth test but fail the stencil test will not be counted.
	31:0	Depth Count LDW This register reflects the depth test in slice5 (i.e., will be visible). All pixels are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Pixels that pass the depth test but fail the stencil test will not be counted.

PS Depth Count for Slice7

PS_DEPTH_COUNT_SLICE7 - PS Depth Count for Slice7		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	64	
Trusted Type:	1	
Address:	025B8h	
Name:	PS Depth Count for Slice7	
ShortName:	PS_DEPTH_COUNT_SLICE7	
This register stores the value of the count of pixels that have passed the depth test in Slice7. This register is part of the render context save and restore. This register should not be programmed by SW.		
DWord	Bit	Description
0..1	63:32	Depth Count UDW This register reflects the depth test in slice5 (i.e., will be visible). All pixels are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Pixels that pass the depth test but fail the stencil test will not be counted.
	31:0	Depth Count LDW This register reflects the depth test in slice5 (i.e., will be visible). All pixels are counted when Statistics Enable is set in the Windower State. See the Windower chapter of the 3D volume for details. Pixels that pass the depth test but fail the stencil test will not be counted.

PS Invocation Count

PS_INVOCATION_COUNT - PS Invocation Count		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	64	
Trusted Type:	1	
Address:	02348h	
DWord	Bit	Description
0..1	63:32	PS Invocation Count UDW Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.
	31:0	PS Invocation Count LDW Reflects a count of the total number of pixels (including unlit "helper pixels" within a subspan that need to go through the PS shader to provide 2x2 gradients) that are dispatched to pixel shader invocations while Statistics Enable is set in the Windower. See the Windower chapter of the 3D volume for details. This count will generally be much greater than the actual count of PS threads since a single thread may process up to 32 pixels.

Register Space:	MMIO: 0/2/0							
Source:	BSpec							
Access:	R/W							
Size (in bits):	32							
Address:	6F900h-6F903h							
Name:	Transcoder EDP PSR2 Control							
ShortName:	PSR2_CTL_EDP							
Power:	PG1							
Reset:	soft							
Programming Notes								
To use FBC modification tracking for idleness calculations when FBC is disabled, program FBC_CTL CPU Fence Enable, FBC_CONTROL_SA_REGISTER, FBC_CPU_FENCE_OFFSET_REGISTER, FBC_RT_BASE_ADDR_REGISTER, and BLITTER_TRACKING_REGISTER as they are programmed when FBC is enabled.								
Restriction								
PSR needs to be enabled only when at least one plane is enabled.								
PSR2 is limited to 24bpp 8:8:8, even when using the manual tracking mode.								
Only the PSR2 Enable can be changed while PSR2 is enabled. The other fields must not be changed while PSR2 is enabled. Selective Update Tracking Enable must be set before or along with PSR2 enable								
PSR2 is supported for pipe active sizes up to 4096 pixels wide and 2304 lines tall.								
DWord	Bit	Description

PTBR Number Of Pages Recorded

DWord		Bit	Description
PTBR_NUM_PAGES_RECORDED_REGISTER - PTBR Number Of Pages Recorded			
Register Space:		MMIO: 0/2/0	
Source:		PositionCS	
Size (in bits):		32	
Address:		18594h	
Name:		Register Template Address	
ShortName:		PTBR_NUM_PAGES_RECORDED_REGISTER	
<p>This is a running count of number of pages allocated by the OVR unit for the visibility data. This includes pages that could have been allocated but were not allocated because the OVR unit early terminated the pages with "out of memory" marker. This register is engine context save/restored.</p>			
0	31:17	Reserved Default Value: 0000000000000000b Access: RO	
	16:0	PTBR_NUM_PAGES_RECORDED Default Value: 0h Access: R/W Format: U17 <p>This is a running count of number of pages allocated by the OVR unit for the visibility data. This includes pages that could have been allocated but were not allocated because the OVR unit early terminated the pages with "out of memory" marker.</p> <p style="text-align: center;">Programming Notes</p> SW must not write to this register.	

PTBR Page Pool Size Register

PTBR_PAGE_POOL_SIZE_REGISTER - PTBR Page Pool Size Register			
Register Space:	MMIO: 0/2/0		
Source:	PositionCS		
Size (in bits):	32		
Address:	18590h		
Name:	Register Template Address		
ShortName:	PTBR_PAGE_POOL_SIZE_REGISTER		
<p>Indicates the size of the PTBR Page Pool Size allocated by SW. The page pool size is with respect to the PTBR_PAGE_POOL_BASE_ADDRESS programmed through 3DSTATE_PTBR_PAGE_POOL_BASE_ADDRESS command. SW can do multiple writes to this register with the increased page pool size as it allocates more pages to the PTBR page pool.</p> <p>Coming out of reset or on executing PTBR_PAGE_POOL_RESTART by 3DSTATE_PTBR_PAGE_POOL_BASE_ADDRESS command, HW initializes PTBR_PAGE_POOL_SIZE to 0x0. HW on detecting a write to this register compares its current PTBR_PAGE_POOL_SIZE with that of the value programmed in this register to add more pages to the Free-List and updates itself with the latest value.</p> <p>This is a non-privileged register and engine context save/restored by HW.</p>			
Programming Notes			
<ul style="list-style-type: none"> SW must not write a value to this register less than the existing value. SW must use the 'Restart' field of the 3DSTATE_PTBR_PAGE_POOL_ADDRESS command to decrease the size of the pool. SW must always program PTBR_PAGE_POOL_SIZE_REGISTER through MI_LOAD_REGISTER_IMM command or any other MI command to load register in the command sequence. SW must ensure following state are set in HW prior to programming this register: 3DSTATE_PTBR_PAGE_POOL_BASE_ADDRESS 3DSTATE_PTBR_FEE_LIST_BASE_ADDRESS 			
DWord	Bit	Description	
0	31:16	Reserved	
		Default Value:	000000000000000b
Access:		RO	
	15:0	PTBR_PAGE_POOL_SIZE	
		Default Value:	0h
		Access:	R/W
		Format:	U16-1
Indicates the PTBR page pool size (4KB granularity). A value of '0x0' indicates a single page and a value of 99h indicates 154 pages are available in the page pool for use by HW. Valid

PWR_WELL_CTL_AUX

PWR_WELL_CTL_AUX		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Access:	R/W	
Size (in bits):	32	
Address:	45440h-45443h	
Name:	Power Well Control AUX 1	
ShortName:	PWR_WELL_CTL_AUX1	
Power:	PG0	
Reset:	soft	
Address:	45444h-45447h	
Name:	Power Well Control AUX 2	
ShortName:	PWR_WELL_CTL_AUX2	
Power:	PG0	
Reset:	soft	
<p>This register is used for display power control. There are multiple instances of this register format to allow software components to have parallel control of the display power. PWR_WELL_CTL_AUX1 is generally used for BIOS to control power. PWR_WELL_CTL_AUX2 is generally used for driver to control power. The power enable requests from all sources are logically ORd together to enable the power, so the power will only disable after all sources have requested the power to disable. When a power well is disabled (powered down), access to any registers in the power well will complete, but write data will be dropped and read data will be all zeroes. The display connections diagram indicates which functional blocks are contained in each power well. The display MMIO register specification has a field for each register to indicate which power well it is in.</p>		
Restriction		
<p>The power request field must not be changed for a resource while a power enable/disable for that resource is currently in progress, as indicated by power well state for that resource.</p>

Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER01 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	R/W	
Size (in bits):	32	
Trusted Type:	1	
Address:	1C920h	
This register stores per segment Bit Rate Control DeltaLoopFilter.		
DWord	Bit	Description
0	31	Reserved Format: MBZ
	30:24	Segment1 CumulativeDeltaLoopFilter Format: S6 This contains Segment1 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment1 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23:22	Reserved Format: MBZ
	21:16	Segment1 LoopFilter Format: U6 This contains Segment1 LoopFilter used in current frame. This register is valid after a BRC pass is done.
	15	Reserved Format: MBZ
	14:8	Segment0 CumulativeDeltaLoopFilter Format: S6 This contains Segment0 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment0 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done. If

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER01 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 01

		Segmentation is not enabled, this field reflects CumulativeDeltaLoopFilter. If Segmentation is enabled, this field reflects Segment0 CumulativeDeltaLoopFilter.
	7:6	Reserved
		Format: MBZ
	5:0	Segment0 LoopFilter
		Format: U6
		This contains Segment0 LoopFilter used in current frame. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects LoopFilter. If Segmentation is enabled, this field reflects Segment0 LoopFilter.

Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER23 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	R/W	
Size (in bits):	32	
Trusted Type:	1	
Address:	1C924h	
This register stores per segment Bit Rate Control DeltaLoopFilter.		
DWord	Bit	Description
0	31	Reserved Format: MBZ
	30:24	Segment3 CumulativeDeltaLoopFilter Format: S6 This contains Segment3 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment3 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23:22	Reserved Format: MBZ
	21:16	Segment3 LoopFilter Format: U6 This contains Segment3 LoopFilter used in current frame. This register is valid after a BRC pass is done.
	15	Reserved Format: MBZ
	14:8	Segment2 CumulativeDeltaLoopFilter Format: S6 This contains Segment2 CumulativeDeltaLoopFilter in Bit Rate Control. It accumulates all Segment2 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	7:6	Reserved

MFX_VP8_BRC_CUMULATIVE_D_LOOP_FILTER23 - Reported BitRateControl CumulativeDeltaLoopFilter and LoopFilter 23

		Format:	MBZ
	5:0	Segment2 LoopFilter	
		Format:	U6
		This contains Segment2 LoopFilter used in current frame. This register is valid after a BRC pass is done.	

Reported BitRateControl CumulativeDeltaQindex and Qindex 01

MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01 - Reported BitRateControl CumulativeDeltaQindex and Qindex 01		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	R/W	
Size (in bits):	32	
Trusted Type:	1	
Address:	12918h	
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01_VB0	
Address:	1C918h	
ShortName:	MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01_VB1	
This register stores per segment Bit Rate Control CumulativeDeltaQindex.		
DWord	Bit	Description
0	31:24	Segment1 CumulativeDeltaQindex
		Format: S7 This contains Segment1 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment1 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done.
	23	Reserved Format: MBZ
	22:16	Segment1 Qindex
Format: U7 This contains Segment1 Qindex used in current frame. This register is valid after a BRC pass is done.		
15:8	Segment0 CumulativeDeltaQindex	
	Format: S7 This contains Segment0 CumulativeDeltaQindex in Bit Rate Control. It accumulates all Segment0 DeltaQindices per pass in Multipass. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects CumulativeDeltaQindex. If Segmentation is enabled, this field reflects Segment0 CumulativeDeltaQindex.	

MFX_VP8_BRC_CUMULATIVE_DQ_INDEX01 - Reported BitRateControl CumulativeDeltaQindex and Qindex 01

7	Reserved	
	Format:	MBZ
6:0	Segment0 Qindex	
	Format:	U7
	This contains Segment0 Qindex used in current frame. This register is valid after a BRC pass is done. If Segmentation is not enabled, this field reflects Qindex. If Segmentation is enabled, this field reflects Segment0 Qindex.	

Reported BitRateControl CumulativeDeltaQindex and Qindex 23

MFX_VP8_BRC_CUMULATIVE_DQ_INDEX23 - Reported BitRateControl CumulativeDeltaQindex and Qindex 23				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS

Reported BitRateControl parameter Mask

MFX_VP8_CNTRL_MASK - Reported BitRateControl parameter Mask		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	12900h	
ShortName:	MFX_VP8_CNTRL_MASK_VB0	
Address:	1C900h	
ShortName:	MFX_VP8_CNTRL_MASK_VB1	
This register stores the count of bytes of the bitstream output per frame		
DWord	Bit	Description
0	31:6	Reserved Format: MBZ
	5	Final Bitstream Buffer Overrun Mask Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit5. This denotes Final bitstream buffer overrun feature is enabled.
	4	Intermediate Bitstream Buffer Overrun Mask Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit4. This denotes intermediate bitstream buffer overrun feature is enabled.
	3	Intra MB Bit Count Conformance Mask Format: U1 This is legacy support as AVC for Intra MB Bit Count conformance. This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit3. This feature is not validated.
	2	Inter MB Bit Count Conformance Mask Format: U1 This is legacy support as AVC for Inter MB Bit Count conformance. This is same bit reflected in

MFX_VP8_CNTRL_MASK - Reported BitRateControl parameter Mask

	MFX_VP8_ENC_CFG DW2 bit2. This feature is not validated.
1	Frame Bit Rate Overflow Mask Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit0. It denotes if Frame Bit Rate Overflow is enabled for Bit Rate Control
0	Frame Bit Rate Underflow Mask Format: U1 This is same bit reflected in MFX_VP8_ENC_CFG DW2 bit1. It denotes if Frame Bit Rate Underflow is enabled for Bit Rate Control

Reported BitRateControl parameter Status

MFX_VP8_CNTRL_STATUS - Reported BitRateControl parameter Status		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	12904h	
ShortName:	MFX_VP8_CNTRL_STATUS_VB0	
Address:	1C904h	
ShortName:	MFX_VP8_CNTRL_STATUS_VB1	
This register stores the count of bytes of the bitstream output per frame		
DWord	Bit	Description
0	31:8	Reserved Format: MBZ
	7	QindexClampHigh Status Format: U1 This denotes if Qindex is clamped by QindexClampHigh value programmed in MFX_VP8_PIC_STATE.DW7.
	6	QindexClampLow Status Format: U1 This denotes if Qindex is clamped by QindexClampLow value programmed in MFX_VP8_PIC_STATE.DW7.
	5	Final Bitstream Buffer Overrun Status Format: U1 This denotes if Final bitstream buffer overrun.
	4	Intermediate Bitstream Buffer Overrun Status Format: U1 This denotes if any of the Intermediate bitstream buffer overrun. (including FrameHeader, Partition1 to Partition8)

MFX_VP8_CNTRL_STATUS - Reported BitRateControl parameter Status

3	Intra MB Bit Count Conformance Status Format: <table border="1"><tr><td>U1</td></tr></table> <p>This is legacy support as AVC for Intra MB Bit Count conformance. It denotes if Intra MB Bit Count meets conformance size. This feature is not validated.</p>	U1	
U1			
2	Inter MB Bit Count Conformance Status Format: <table border="1"><tr><td>U1</td></tr></table> <p>This is legacy support as AVC for Inter MB Bit Count conformance. It denotes if Inter MB Bit Count meets conformance size. This feature is not validated.</p>	U1	
U1			
1	Frame Bit Rate Overflow Status Format: <table border="1"><tr><td>U1</td></tr></table> <p>It denotes if Frame Bit Rate Overflow in current frame</p>	U1	
U1			
0	Frame Bit Rate Underflow Status Format: <table border="1"><tr><td>U1</td></tr></table> <p>It denotes if Frame Bit Rate Underflow in current frame</p>	U1	
U1			

Reported Bitstream Output Bit Count for Syntax Elements Only

HCP_BITSTREAMSE_BITCOUNT_FRAME - Reported Bitstream Output Bit Count for Syntax Elements Only				
Register Space:	MMIO: 0/2/0			
Source:	VideoCS			
Access:	RO			
Size (in bits):	32			
Trusted Type:	1			
Address:	1E9A8h			
<p>This register stores the count of number of bits in the bitstream due to syntax elements only. This excludes header/ byte alignment /tail/EMU/CABAC-0word/padding bits but includes the stop-one-bit. This register is part of the context save and restore.</p>				
DWord	Bit	Description		
0	31:0	<p>HCP Bitstream Syntax Element Only Bit Count</p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>Total number of bits in the bitstream output due to syntax elements only. It includes the data bytes only. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.</p>	Format:	U32
Format:	U32			

Reported Bitstream Output Bit Count for Syntax Elements Only Register

MFC_BITSTREAM_SE_BITCOUNT_FRAME - Reported Bitstream Output Bit Count for Syntax Elements Only Register		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	128A4h	
<p>This register stores the count of number of bits in the bitstream due to syntax elements only. This excludes header/ byte alignment /tail/EMU/CABAC-0word/padding bits but includes the stop-one-bit. This register is part of the context save and restore.</p>		
DWord	Bit	Description
0	31:0	MFC Bitstream Syntax Element Only Bit Count Total number of bits in the bitstream output due to syntax elements only. It includes the data bytes only. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

Reported Bitstream Output Byte Count per Frame Register

MFC_BITSTREAM_BYTECOUNT_FRAME - Reported Bitstream Output Byte Count per Frame Register		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	128A0h	
This register stores the count of bytes of the bitstream output per frame		
DWord	Bit	Description
0	31:0	MFC Bitstream Byte Count per Frame Total number of bytes in the bitstream output per frame from the encoder. This includes header/tail/byte alignment/data bytes/EMU (emulation) bytes/cabac-zero word insertion/padding insertion. This count is updated for every time the internal bitstream counter is incremented and its reset at image start.

Reported Bitstream Output Byte Count per Tile

HCP_BITSTREAM_BYTECOUNT_TILE - Reported Bitstream Output Byte Count per Tile		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	1E9CCh	
This register stores the count of bytes of the bitstream output per tile.		
DWord	Bit	Description
0	31:0	HCP Bitstream Byte Count per Tile Format: U32 Total number of bytes in the bitstream output per Tile from the encoder. This includes header/byte alignment/data bytes/EMU (emulation) bytes/. This count is updated for every time the internal bitstream counter is incremented and its reset at tile start.

Reported Bitstream Output CABAC Bin Count Register

MFC_AVC_CABAC_BIN_COUNT_FRAME - Reported Bitstream Output CABAC Bin Count Register		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	128A8h	
This register stores the count of number of bins per frame.		
DWord	Bit	Description
0	31:0	MFC AVC Cabac Bin Count Total number of BINs in the bitstream output per frame from the encoder. This count is updated for every time the bin counter is incremented and its reset at image start.

Reported Bitstream Output CABAC Insertion Count

HCP_CABAC_INSERTION_COUNT - Reported Bitstream Output CABAC Insertion Count		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	1E9B0h	
This register stores the count in bytes of CABAC ZERO_WORD insertion. It is primarily provided for statistical data gathering .		
DWord	Bit	Description
0	31:0	HCP Cabac Insertion Count Format: U32 Total number of bytes in the bitstream output before for the CABAC zero word insertion. This count is updated each time when the insertion count is incremented.

Reported Final Bitstream Byte Count

MFX_VP8_FRM_BYTE_CNT - Reported Final Bitstream Byte Count		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	12908h	
Address:	1C908h	
This register stores the count of bytes of the bitstream output per frame		
DWord	Bit	Description
0	31:0	Final BitStream Byte Count
		Format: U32
		This register contains Final Bitstream byte count

Reported Frame Zero Padding Byte Count

MFX_VP8_FRM_ZERO_PAD - Reported Frame Zero Padding Byte Count		
Register Space:	MMIO: 0/2/0	
Source:	VideoCS	
Access:	RO	
Size (in bits):	32	
Trusted Type:	1	
Address:	1290Ch	
ShortName:	MFX_VP8_FRM_ZERO_PAD_VB0	
Address:	1C90Ch	
ShortName:	MFX_VP8_FRM_ZERO_PAD_VB1	
This register stores Frame Zero Padding Byte Count		
DWord	Bit	Description
0	31:16	Reserved Format: MBZ
	15:0	Frame Zero Padding Byte Count Format: U16 This register contains Frame Zero Padding byte count This is legacy support. This feature is not validated.

Reported Timestamp Count

TIMESTAMP - Reported Timestamp Count

ShortName:	TIMESTAMP_VECSUNIT3

Description	Source
This register provides an elapsed real-time value that can be used as a timestamp for GPU events over short periods of time. Note that the value of this register can be obtained in a 3D pipeline-synchronous fashion without a pipeline flush by using the PIPE_CONTROL command. See 3D Geometry Pipeline in the "3D and Media" volume. This register (effectively) counts at a constant frequency by adjusting the increment amount according to the actual reference clock frequency. SW therefore does not need to know the reference clock frequency.	RenderCS
This register provides an elapsed real-time value that can be used as a timestamp. The accumulated value in this register is of the timestamp stamp granularity (base unit) defined in the "Time Stamp Bases" subsection in Power Management chapter.	BlitterCS, VideoCS, VideoCS2, VideoEnhancementCS
This register is <i>not</i> reset by a <u>graphics</u> reset. It will maintain its value unless a full chipset reset is performed.	

DWord	Bit	Description
0..1	63:36	Reserved Format: MBZ
	35:32	Timestamp Value UN Format: U4

TIMESTAMP - Reported Timestamp Count

		This register increment's for every timestamp base unit. The granularity of the time stamp base unit is defined in the "Time Stamp Bases" subsection in Power Management chapter. Note: This is the Upper Nibble of the Timestamp Value, a 36-bit signal.
	31:0	Timestamp Value LDW Format: U32 This register increment's for every timestamp base unit. The granularity of the time stamp base unit is defined in the "Time Stamp Bases" subsection in Power Management chapter.

ShortName: RESET_CTRL_VECSUNIT3

Soft reset flow for an engine (Render, Blitter, Video, Video Enhancement) is asynchronous to the context execution in HW. SW needs a deterministic way to ensure it resets the context it intends to. One way to achieve this is to ensure HW doesn't switch out the context while SW is doing a soft reset. This is achieved by having an explicit interface between HW-SW to prepare the engine prior to the soft reset. SW sets the "Request Reset" in RESET_CTRL register of an engine indicating SW wants to initiate a soft reset flow for the corresponding engine. In response to "Request Reset" bit set, HW sets "Ready for Reset" bit of RESET_CTRL register indicating engine readiness for reset. As part of the reset readiness HW will not allow any context switch to take place and also ensure any ongoing context switch is paused on a clean context boundary (context save in progress is completed, Context Switch Status Buffer updates are allowed to complete).

SW polls for "Ready for Reset" bit to be set before it does soft reset for the corresponding engine. Reading EXECLIST_STATUS register at this point provides the active context in HW that will get reset. On engine reset "Request Reset" bit will get reset with rest of the engine logic.

Upon polling EXECLIST_STATUS register for active context SW might decide not to reset the engine and can reset the "Request Reset" in RESET_CTRL register. On "Request Reset" getting reset by SW, HW must continue with execution.

SW setting "Ready for Reset" bit in RESET_CTRL register of an engine need not be followed by the corresponding engine reset.

SW writing to "Request Reset" bit in RESET_CTRL register is preparing the engine for reset whereas SW writing to GDRST triggers the actual reset flow in HW.

Programming Notes

SW must not do Reset Readiness Handshake as part of the reset recovery on an CAT error.

RESET_CTRL - Reset Control Register

Description

This register contains the Head pointer offset in the ring when the last PREEMPTABLE command was executed and caused the head pointer to move due to the UHPTR register being valid. If the PREEMPTABLE command is executed as part of the batch buffer then the value of the register will be the offset in the ring of the command past the batch buffer start that contained the preemptable command.

This is a global register and context save/restored as part of power context image.

Description

These registers are used to define and operate the "ring buffer" mechanism which can be used to pass instructions to the command interface. The buffer itself is located in a linear memory region. The ring buffer is defined by a 4 Dword register set that includes starting address, length, head offset, tail offset, and control information. These registers can only be updated through a restore of a context thru execution list submission.

DWord	Bit	Description									
0	31:21	Reserved									
		Format: MBZ									
	20:12	Buffer Length									
		Format: U9-1 in 4 KB pages - 1									
This field is written by SW to specify the length of the ring buffer in 4 KB Pages. Range = [0 = 1 page = 4 KB, 1FFh = 512 pages = 2 MB]											
		<table border="1" style="width: 100%; text-align: center;"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td></td> <td>1 page = 4 KB</td> </tr> <tr> <td>1FFh</td> <td></td> <td>512 pages = 2 MB</td> </tr> </tbody> </table>	Value	Name	Description	0		1 page = 4 KB	1FFh		512 pages = 2 MB
Value	Name	Description									
0		1 page = 4 KB									
1FFh		512 pages = 2 MB									
11	RBWait	Indicates that this ring has executed a WAIT_FOR_EVENT instruction and is currently waiting. Software can write a "1" to clear this bit, write of "0" has no effect. When the RB is waiting for an									

RING_BUFFER_CTL - Ring Buffer Control

		event and this bit is cleared, the wait will be terminated and the RB will be returned to arbitration.									
10	Semaphore Wait	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th colspan="2" style="text-align: center; background-color: #e1eef6;">Description</th> </tr> <tr> <td colspan="2">Indicates that this ring has executed a MI_SEMAPHORE_WAIT instruction and is currently waiting for wait condition to satisfy. 		Description									
		Automatic reporting disabled									
		Report every 16 pages (64KB)									
		Report every page (4KB) This mode must not be enabled in Ring Buffer mode of scheduling to minimize the auto reports.									
		Report every 32 pages (128KB).									
0	Ring Buffer Enable										

RING_BUFFER_CTL - Ring Buffer Control

Format:	Enable
<p>This field is used to enable or disable this ring buffer. It can be enabled or disabled regardless of whether there are valid instructions pending. If disabled and the ring head equals ring tail, all state currently loaded in hardware is considered invalid.</p>	
Programming Notes	Source
<p>Ring Buffer Mode of Scheduling: SW must follow the below programming notes during SW initialization phase or while enabling render engine's ring buffer for the first time, this would be coming out of boot, standby, hibernate or reset. This flow must be also followed during ring replay when ring buffer is disabled.</p> <ul style="list-style-type: none">• SW must set the Force Wakeup bit to prevent GT from entering C6.• SW must dispatch workload (dummy context) to initialize render engine with default state such that any context switches that occur subsequently (Power Save) will save and restore coherent device state. Indirect pointers used in 3D states must point to valid graphics surface existing in memory. PP_DCLV followed by PP_DIR_BASE register should be programmed as part of initialization workload if PPGTT is enabled in GFX_MODE register.• SW must ensure all the register (MMIO) initialization/programming through CPU happens in this block or latter, this ensures the MMIO state is save/restored on subsequent context switches (Power Sequences).• Once the render engine is programmed with valid state and the configuration, Force Wakeup bit should be reset to enable C6 entry.	RenderCS

<p>This register has bit-wise masking applied for writes. The register consists of 16 bits of data in [15:0], and 16 bits of corresponding masks in [31:16]. To set bit0, for example, the data would be 0x0001_0001. To clear bit0, for example, the data would be 0x0001_0000. Note that mask bit is the data bit offset + 16.</p>			
DWord	Bit	Description	
0	31:16	Mask	
		Access:	WO
		Format:	Mask[15:0]
	15	enable smallPL	
		Format:	enable
		Programming Notes	
		This bit MUST be set to ensure optimal power in 3D Sampler.	
		Must not be enabled if cache_flush message is sent to sampler.	
	14	ECO Reserved 1B	
		Format:	MBZ
	13:12	Sampler Cache Set XOR selection	
		Format:	U2
These bits have an impact only when the Sampler cache is configured in 16 way set associative mode. If the cache is being used for immediate data or for blitter data these bits have no effect.			
Value		Name	Description
00b	None	No XOR.	

SAMPLER_MODE - SAMPLER Mode Register

		01b	Scheme 1	<p>New_set_mask[3:0] = Tiled_address[16:13]. New_set[3:0] less than or = New_set_mask[3:0] ^ Old_set[3:0]. Rationale: These bits can distinguish among 16 different equivalent classes of virtual pages. These bits also represent the lsb for tile rows ranging from a pitch of 1 tile to 16 tiles.</p>									
		10b	Scheme 2	<p>New_set_mask[3] = Tiled_address[17] ^ Tiled_address[16]. New_set_mask[2] = Tiled_address[16] ^ Tiled_address[15]. New_set_mask[1] = Tiled_address[15] ^ Tiled_address[14]. New_set_mask[0] = Tiled_address[14] ^ Tiled_address[13]. New_set[3:0] less than or = New_set_mask[3:0] ^ Old_set[3:0]. Rationale: More bits on each XOR can give better statistical uniformity on sets and since two lsbs are taken for each tile row size, it reduces the chance of aliasing on sets.</p>									
		11b	Scheme 3 [Default]	<p>New_set_mask[3] = Tiled_address[22] ^ Tiled_address[21] ^ Tiled_address[20] ^ Tiled_address[19]. New_set_mask[2] = Tiled_address[18] ^ Tiled_address[17] ^ Tiled_address[16]. New_set_mask[1] = Tiled_address[15] ^ Tiled_address[14]. New_set_mask[0] = Tiled_address[13]. New_set[3:0] less than or = New_set_mask[3:0] ^ Old_set[3:0]. Rationale: More bits on each XOR can give better statistical uniformity on sets and since each XOR has different bits, it reduces the chance of aliasing on sets even more.</p>									
Programming Notes													
This field should be programmed as "00b" corresponding to NO XOR option when 3D map performance fix in MT is enabled using the field "Sampler Set Remapping for 3D Disable" in the SAMPLER Mode Register.													
11:10	ECO Reserved 2b

Will disable the L2 cache and force all access to be misses													

SAMPLER_MODE - SAMPLER Mode Register

7	ECO Reserved 3	
Format:		MBZ
6	Compressed Overfill disable	
Format:		disable
5	Headerless Message for Pre-emptable Contexts	
Format:		Enable
<p>When set to 1h, this bit forces sampler to receive the Binding Table Pointer (BTP) directly from the incoming message rather than from the Header Bypass Ram which is written at thread dispatch. This enables sampler to support headerless messages for pre-emptable GPGPU contexts. When set to 0h, it reverts to the previous behavior where BTP is taken from the Header Bypass RAM for headerless messages and pre-emptable GPGPU contexts must have headers on all sampler messages. This bit is ignored for messages with headers.</p>		
Value	Name	Description
0h	[Default]	For headerless messages sampler will take Binding Table Pointer (BTP) from the Header Bypass RAM written by the thread dispatch and message headers must be used on all sampler messages for Pre-emptable contexts.
1h		For headerless messages sampler will take Binding Table Pointer (BTP) from the incoming message and sampler may be used for pre-emptable contexts.
4	Lossless Overfetch Disable	
<p>This bit, controls the amount of data fetched per texel for losslessly compressed surfaces which are non-expandable formats.</p> <p>An expandable format is a format where the color channels are expanded to a power-of-2 number of bits when fetched from memory.</p> <p>R8G8B8A8_UNORM is an example of a non-expandable format.</p> <p>R10G10B10A2_UNORM is an example of an expandable format.</p>		
Value	Name	Description
0h	En_ovf_dis	When programmed to 0h, over fetching is enabled for all losslessly compressed surfaces
1h	Dis_ovf_dis [Default]	When programming to 1h, overfetch is disabled only for losslessly compressed surfaces which are non- expandable formats. A non-expandable format is a format where the color channels are not expanded to a power-of-2 number of bits when fetched from memory. R8G8B8A8_UNORM is an example of a non-expandable format. R10G10B10A2_UNORM is an example of an expandable format.
Programming Notes		

SAMPLER_MODE - SAMPLER Mode Register

		This bit should be programmed to 1h (disabled) by software to ensure optimal performance.	
3	ECO Reserved 5		
	Format:		MBZ
2	ECO Reserved 4-2		
1	Overfetch Heuristic Enable		
	Format:		Enable
	When disabled sampler will perform a heuristic analysis of the spread of pixels within a sampled subspan and disable overfetching for uncompressed lines of a losslessly compressed surface		
0	Indirect State Base Addr Override		
	Format:		Enable
	This bit is used to control whether Indirect State (Border Color) to be relative to same base address as SAMPLER_STATE or relative to the DYNAMIC_STATE_BASE_ADDR

SCRATCH2 - SCRATCH2 Register

18:15	SCRATCH18	
14:10	LTCD EBB Conflict URB-Read Aging count	
		This bit-field is no longer used as an aging counter since hardware consuming this field doesn't exist anymore. Instead it will be used to improve visibility in LTCC and LTCD.
	Value	Name
	31	[Default]
	[0,31]	
9	LTCD EBB Conflict URB-Read Aging enable	
		This bit-field is no longer used as an aging counter enable since hardware consuming this field doesn't exist anymore. Retaining bitfield definition for future use.
	Value	Name
	1	[Default]
	0	
8:4	LTCD EBB Conflict L3-Read Aging count	
		This bit-field will determine the number of EBB conflicts experienced by the L3-read in order to age in the L3 FIFO.
	Value	Name
	10	[Default]
	[1,31]	
3	LTCD EBB Conflict L3-Read Aging enable	
		This bit-field will enable L3-Read aging in LTCD dataunit due to EBB conflicts. During EBB conflicts, L3-fill will be preferred over L3-reads, and this aggressive fill selection can hold up the reads in L3 FIFO depending on the duration of EBB conflicts. L3-read aging will ensure fairness to an L3-read cycle that has been held back due to EBB conflicts by making the L3-fills ineligible once the read has aged.
	Value	Name
	1	[Default] LTCD EBB conflict L3-Read aging is enabled
	0	LTCD EBB conflict L3-Read aging is disabled
2	LTCD URB FIFO OOO Disable	
		This bit-field will disable URB FIFO OOO implementation in LTCD-dataunit and revert to an implementation where only one URB FIFO was used.
	Value	Name
		Description

SCRATCH2 - SCRATCH2 Register

	0	[Default]	LTCD URB FIFO OOO implementation is enabled

SCRATCH3 - SCRATCH3 Register

		Value	Name	Description
		1		LSQD FIFO-0 reads will not go on lne port1 if lneport0 doesn't have credits
		0	[Default]	LSQD FIFO-0 reads will go on lne port1 if lneport0 doesn't have credits
1	Memory Read Return Port1 Stall Fix Disable			
	This register field determines stalling behavior of LTCD/LSQD when memory read returns on port1 conflict with data-response from LTCD.			
		1		LTCD stalls DRSP on phase0 and phase1 when memory read return happens on port1
		0	[Default]	LTCD stalls DRSP on phase1 when memory read return happens on port1
Programming Notes				
This register field cannot be programmed to 0 if PARWRFIXDIS bitfield in register SCRATCH3 in LBCF is programmed to 1.				
0	Early recycle on eviction response			
	When enabled forces the broadcast of early recycle event when the tag response is an eviction even if early recycling is disable via the early recycle bit.			
		1	[Default]	Forces the broadcast of early recycle event when the tag response is an eviction
		0		Early recycle broadcast is based on the early recycle bit and the snoop pending status

SBB_PREEMPT_ADDR - Second Level Batch Buffer Head Pointer Preemption Register

Description

This register gets updated with the DWord-aligned graphics memory address of the PREEMPTABLE command in the second level batch buffer on which preemption has occurred.

This register value should be looked at only when the preemption has occurred in the second level batch buffer. This is indicated by "Ring/Batch Indicator" in "RING_BUFFER_HEAD_PREEMPT_REG". This register value retains its previous value and doesn't change when the preemption occurs on a preemptable command in ring buffer or in batch buffer.

Preemption is triggered by valid UHPTR in ring buffer mode of scheduling and by a pending execlist in Exec-List mode of scheduling.

This is a global register and context save/restored as part of power context image.

Refer to **Preemption > Execlist Scheduling** for a list of preemptible commands.

Programming Notes

Programming Restriction: This register should NEVER be programmed by driver, this is for HW internal use only.

Slice unit Level Clock Gating override during rstflow 94F0

SCMISCCP94F0 - Slice unit Level Clock Gating override during rstflow 94F0		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Size (in bits):	32	
Address:	094F0h	
Unit Level Clock Gating Disable bits		
DWord	Bit	Description
0	31	clock gate control Lock
		Access:
		R/W Lock
0 = Bits of MISCCPCTL register are R/W 1 = All bits of MISCCPCTL register are RO (including this lock bit) Once written to 1, the lock is set and cannot be cleared (i.e., writing a 0 will not clear the lock). These bits are not reset on FLR.		
	30:1	Reserved
		Access:
		R/W
Reserved		
0	0	L1UGT during rst flow
		Default Value:
		1b
Access:		R/W
miscpc Clock Gating Disable Control: '0' : Clock Gating Enabled during reset flows (i.e., clocks can be gated when they are not required to toggle for functionality, NOT Recommended) '1' : Clock Gating Disabled during reset flows. (i.e., clocks are toggling, always) Register bit defaults to value 1'b1, which is a requirement due to Synchronous reset flops Randomizing this bit will result in X flush not completing during the simulation		

SLM Bank Hash

SLM_BANKHASH - SLM Bank Hash				
Register Space:	MMIO: 0/2/0			
Source:	BSpec			
Size (in bits):	32			
Address:	0E660h			
Register for XOR hashing SLM bank select bits.				
DWord	Bit	Description		
0	31:16	Reserved		
		Format: MBZ		
	15:12	bit5 Hash		
		Access: R/W		
		Format: U4		
		This field defines which address bit(s) will be XOR-ed with address bit[5] to produce new address bit[5]. Multiple bits can be set to XOR multiple address bit with bit[5].		
		Value	Name	Description
		1h	A9	When set, XOR address[5] with address[9] to produce new address[5].
		2h	A13	When set, XOR address[5] with address[13] to produce new address[5].
	4h	A17	When set, XOR address[5] with address[6] to produce new address[5].	
8h	A10	When set, XOR address[5] with address[10] to produce new address[10].		
0h	No XOR [Default]	Address[5] is not XOR-ed with any other address bit.		
11:8	bit4 Hash	Access: R/W		
		Format: U4		
	This field defines which address bit(s) will be XOR-ed with address bit[4] to produce new address bit[4]. Multiple bits can be set to XOR multiple address bit with bit[4].			
	Value	Name	Description	
	1h	A8	When set, XOR address[4] with address[8] to produce new address[4].	
2h	A12	When set, XOR address[4] with address[12] to produce new address[4].		

SLM_BANKHASH - SLM Bank Hash

	4h	A16	When set, XOR address[4] with address[16] to produce new address[4].
	8h	A9	When set, XOR address[4] with address[9] to produce new address[4].
	0h	No XOR [Default]	Address[4] is not XOR-ed with any other address bit.
7:4	bit3 Hash		
	Access:		R/W
	Format:		U4
	This field defines which address bit(s) will be XOR-ed with address bit[3] to produce new address bit[3]. Multiple bits can be set to XOR multiple address bit with bit[3].		
	Value	Name	Description
	1h	A7	When set, XOR address[3] with address[7] to produce new address[3].
	2h	A11	When set, XOR address[3] with address[11] to produce new address[3].
	4h	A15	When set, XOR address[3] with address[15] to produce new address[3].
	8h	A8	When set, XOR address[3] with address[8] to produce new address[3].
	0h	No XOR [Default]	Address[3] is not XOR-ed with any other address bit.
3:0	bit2 Hash		
	Access:		R/W
	Format:		U4
	This field defines which address bit(s) will be XOR-ed with address bit[2] to produce new address bit[2]. Multiple bits can be set to XOR multiple address bit with bit[2].		
	Value	Name	Description
	1h	A6	When set, XOR address[2] with address[6] to produce new address[2].
	2h	A10	When set, XOR address[2] with address[10] to produce new address[2].
	4h	A14	When set, XOR address[2] with address[14] to produce new address[2].
	8h	A7	When set, XOR address[2] with address[7] to produce new address[7].
	0h	No XOR [Default]	Address[2] is not XOR-ed with any other address bit.

Snoop control register

SNPCR - Snoop control register		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Size (in bits):	32	
Address:	0900Ch	
Snoop control register		
DWord	Bit	Description
0	31:23	Reserved Access: <input type="text"/> RO
	22:21	Spare <input type="text"/>
	20	Non Temporal Access: <input type="text"/> R/W Indication to uncore that - Request is of the type that should get minimal cache resources in the uncore.
	19:17	RSVD Access: <input type="text"/> RO
	16	Restrict Snoops to MSQC, no forwarding to L3 Access: <input type="text"/> R/W 1'b0 - Snoops are not restricted. 1'b1 - Restrict snoops to MSQC and do not forward to Node snoop unit (L3).
	15	Thread ID Access: <input type="text"/> R/W 1 bit Thread ID for GT.
	14	Force Invalidate Access: <input type="text"/> R/W Force Invalidate - Forces the invalidate flag to be set with snoop lookups all the time. 0: Normal invalidation (based on req) - Default. 1: Forced invalidation.
	13:11	IDI Pend Timer Default Value: <input type="text"/> 011b

SNPCR - Snoop control register

		Access:	R/W
		<p>IDlpend timer - Time to wait before monitoring the sq_snpc_idlpend signal.</p> <p>000b => 0 clocks.</p> <p>001b => 1 clock.</p> <p>010b => 2 clocks.</p> <p>011b => 4 clocks (default.)</p> <p>100b => 8.</p> <p>101b => 16.</p> <p>110b => 32.</p> <p>111b => 64.</p>	
10:8	Retry Limit	Default Value:	011b
		Access:	R/W
		<p>Retry Limit - Number of times to retry before switching to the freeze mechanism.</p> <p>000b => Always freeze (first shot).</p> <p>001b => 1 retry.</p> <p>010b => 2 retry.</p> <p>011b => 4 retry (default).</p> <p>100b => 8 retry.</p> <p>101b => 16 retry.</p> <p>110b => 32 retry.</p> <p>111b => infinite (no freeze).</p>	
7:3	Retry Timer	Default Value:	01000b
		Access:	R/W
		<p>Retry Timer - Time between receiving a reject from SQ and repeating the monitor sequence.</p> <p>00000b => 0 clocks.</p> <p>00001b => 1 clock.</p> <p>00010b => 2 clocks.</p> <p>00011b => 3 clocks.</p> <p>00111b => 7 clocks.</p> <p>01000b => 8 clocks (Default).</p> <p>...</p> <p>11111b => 32 clocks.</p>	
2:0	MLCSQ Timer	Access:	R/W
		<p>MLC-SQ Timer - Time between doing an MLC lookup and SQ lookup.</p> <p>000b => 0 clocks (default).</p> <p>001b => 1 clock.</p> <p>010b => 2 clocks.</p>	

SNPCR - Snoop control register	
	011b => 4 clocks. 100b => 8. 101b => 16. 110b => 32. 111b => 64.

SQ Error Status

Power:	PG2
Reset:	soft
Address:	6F800h-6F803h
Name:	Transcoder EDP SRD Control
ShortName:	SRD_CTL_EDP
Power:	PG1
Reset:	soft
Description	
Restriction : PSR needs to be enabled only when at least one plane is enabled.	
Programming Notes	
To use FBC modification tracking for idleness calculations when FBC is disabled, program FBC_CTL CPU Fence	

SRD_CTL

Enable, FBC_CONTROL_SA_REGISTER, FBC_CPU_FENCE_OFFSET_REGISTER, FBC_RT_BASE_ADDR_REGISTER, and BLITTER_TRACKING_REGISTER as they are programmed when FBC is enabled.

Cursor front buffer modifications are not tracked in hardware. If the cursor front buffer is modified, touch (write without changing) any cursor register to trigger the PSR idleness tracking.

Restriction

Only the SRD Enable and Single Frame Update Enable fields can be changed while SRD is enabled. The other fields must not be changed while SRD is enabled.

DWord	Bit	Description								
0	31	<p>SRD Enable</p> <p>This bit enables the Self Refreshing Display function. Updates will take place at the start of the next vertical blank. The port will send SRD VDMs while enabled. When idleness conditions have been met for the programmed number of idle frames, hardware will enter SRD (sleep) and can disable the link and stop fetching data from memory. When activity occurs, hardware will exit SRD (wake) and re-enable the link and resume fetching data from memory.</p> <table border="1" style="width: 100%;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Disable</td> </tr> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Enable</td> </tr> </tbody> </table> <p style="text-align: center;">Restriction</p> <p>SRD must not be enabled when the PSR Setup time from DPCD 00071h is greater than the time for vertical blank minus one line.</p> <p>SRD must not be enabled together with Interlacing, Black Frame Insertion (BFI), or audio on the same transcoder.</p>	Value	Name	0b	Disable	1b	Enable

26:25	Reserved	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 60%;">Format:</td> <td style="text-align: center;">MBZ</td> </tr> </table>	Format:	MBZ																
Format:	MBZ																			
24:20	Max Sleep Time																			

SRD_CTL

		Default Value:	00001b 1/8 second
		This field is the maximum time to spend in SRD (sleeping). It is programmed in increments of approximately 1/8 a second. Programming all 1s gives ~3.875 seconds.	
		Restriction	
		Programming all 0s is invalid.	
19:14	Reserved		
		Format:	MBZ
13	TPS4 Control		
	Value	Name	Description
	0b	Complete	Completes TPS4 pattern after TP4 counter expires.
	1b	Terminate	Terminates TPS4 pattern after TP4 counter expires.
12	Reserved		
11	TP2 TP3 Select		
	This field controls whether TP1 is followed by TP2 or TP3 for training the link on exiting SRD (waking).		
	Value	Name	Description
	0b	TP2	Use TP1 followed by TP2
	1b	TP3	Use TP1 followed by TP3
	Programming Notes		
	This bit impacts PSR2. Clear it before enabling PSR2 and do not set it while PSR2 is enabled.		
10	CRC Enable		
	This field controls whether the PSR CRC value will be placed in the VSC packet.		
	Value	Name	Description
	0b	Disable	Disable CRC output in VSC. VSC packet CRC value will be populated by VIDEO_DIP_DATA.
	1b	Enable	Enable CRC output in VSC. VSC packet CRC value will be populated by the calculated CRC value.
	Programming Notes		
	When CRC is enabled, the Max Sleep Timer should be disabled to provide additional power savings. Disable the Max Sleep Timer by setting register 0x6F860 bit 28 to 1. Re-enable the Max Sleep Timer by clearing register 0x6F860 bit 28 to 0.		
	Workaround		

SRD_CTL

	When Single Frame Update is enabled, the CRC must be disabled for panel compatibility.		
9:8	TP2 TP3 Time		
	This field selects the TP2 or TP3 time when training the link on exiting SRD (waking).		
	Value	Name	
	00b	500us	
	01b	100us	
	10b	2.5ms	
	11b	0us Skip TP2/TP3	
7:6	TP4 time		
	This field selects the TP4 time when training the link on exiting SRD (waking). If this field is set to any value other than "11", TP4 pattern will be sent at PSR reentry.		
	Value	Name	Description
	00b	500 us	
	01b	100 us	
	10b	2.5 ms	
	11b	0 us	Skip TP4
5:4	TP1 Time		
	This field selects the TP1 time when training the link on exiting SRD (waking).		
	Value	Name	Description
	00b	500us	
	01b	100us	
	10b	2.5ms	
	11b	0us	Skip TP1
3:0	Idle Frames		
	Default Value:	0001b 1 idle frame	
This field is the number of idle frames required before entering SRD (sleeping).

Reset:	soft	
DWord	Bit	Description
0	31:24	Reserved
		Format: MBZ
	23:0	SRD Perf Cnt This field increments every millisecond while in SRD (sleeping) and the display CD clock is

SRD_PERF_CNT

		running. It will stop incrementing when out of SRD (awake), then resume when back in SRD (sleeping). The value is maintained while SRD is disabled, and counting will resume from the previous value when SRD is re-enabled. Writes to this register will set the count to the written value, then it will increment from that value onwards.

DWord	Bit	Description
0	31:29	SRD State
		Access: RO
		This field indicates the live state of SRD

SRD_STATUS

		Value	Name	Description
		000b	IDLE	Reset state
		001b	SRDONACK	Wait for TG/Stream to send on frame of data after SRD conditions are met
		010b	SRDENT	SRD entry with Link OFF
		011b	BUFOFF	Wait for buffer turn off
		100b	BUFON	Wait for buffer turn on
		101b	AUXACK	Wait for AUX to acknowledge on SRD exit
		110b	SRDOFFACK	Wait for TG/Stream to acknowledge the SRD VDM exit
		111b	SRDENT_ON	SRD entry with Link ON
		Others	Reserved	Reserved
28	Reserved	Format: _____ MBZ		
27:26	Link Status	Access: _____ RO		
	This field indicates the live status of the link.			
		Value	Name	Description
		00b	Full Off	Link is fully off
		01b	Full On	Link is fully on
		10b	Standby	Link is in standby
		11b	Reserved	Reserved
25	Reserved	Format: _____ MBZ		
24:20	Max Sleep Time Counter	Access: _____ RO		
	This field provides the live status of the sleep time counter.			
19:16	SRD Entry Count	Access: _____ RO		
	The value in this register represents the number of times SRD has been entered (gone to sleep). The count will increment with each entry. After reaching the maximum count value the counter will rollover and continue from 0.			
15	Aux Error	Access: _____ RO		
	This field indicates an error on the last SRD AUX handshake.			
		Value	Name	Description

SRD_STATUS

	0b	No Error	AUX had no error
	1b	Error	AUX error (receive error or timeout) occurred
14:13	Reserved		
	Format:		MBZ
12	Sending Aux		
	Access:		RO
	This field indicates if the SRD AUX handshake is currently being sent.		
	Value	Name	Description
	0b	Not Sending	Not sending AUX handshake
	1b	Sending	Sending AUX handshake
11:10	Reserved		
	Format:		MBZ
9	Sending Idle		
	Access:		RO
	This field indicates if idles are currently being sent.		
	Value	Name	Description
	0b	Not Sending	Not sending idle
	1b	Sending	Sending idle
8	Sending TP2 TP3		
	Access:		RO
	This field indicates if TP2 or TP3 is currently being sent.		
	Value	Name	Description
	0b	Not Sending	Not sending TP2 or TP3
	1b	Sending	Sending TP2 or TP3
7	Sending TP4		
	Access:		RO
	This field indicates if TP4 is currently being sent.		
	Value	Name	
	0b	Not Sending	
	1b	Sending	
6:5	Reserved		
	Format:		MBZ
4	Sending TP1		
	Access:		RO
	This field indicates if TP1 is currently being sent.		

SRD_STATUS		
Value	Name	Description
0b	Not Sending	Not sending TP1
1b	Sending	Sending TP1
3:0	Idle Frame Counter	
	Access:	RO
	This field provides the live status of the idle frame counter.	
	Programming Notes	
The value of this field is not preserved across power down states such as DC5 and up.

Stream Output 0 Primitive Storage Needed Counter

SO0_PRIM_STORAGE_NEEDED - Stream Output 0 Primitive Storage Needed Counter

Register Space: MMIO: 0/2/0

Source: RenderCS

Access: R/W

Size (in bits): 64

Address: 05240h-05247h

Name: Stream Output 0 Primitive Storage Needed Counter

ShortName: SO0_PRIM_STORAGE_NEEDED

There is one 64-bit register for each of the 4 supported streams:

- 5240h-5247h SO_PRIM_STORAGE_NEEDED0 (for Stream Out Stream #0)
- 5248h-524Fh SO_PRIM_STORAGE_NEEDED1 (for Stream Out Stream #1)
- 5250h-5257h SO_PRIM_STORAGE_NEEDED2 (for Stream Out Stream #2)
- 5258h-525Fh SO_PRIM_STORAGE_NEEDED3 (for Stream Out Stream #3)

These registers are used to count the number of primitives (aka objects: points, lines, triangles) which the SO stage has or would have written to a particular "stream's" Streamed Vertex Output buffers if all buffers had been large enough to accommodate the writes. (See the Stream Output section of the 3D pipeline volume).

These registers are part of the context save and restore.

0	31:0	<p>Prim Storage Needed Count 0</p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.</p>	Format:	U32
Format:	U32			
1	31:0	<p>Prim Storage Needed Count 1</p> <table border="1"> <tr> <td>Format:</td> <td>U32</td> </tr> </table> <p>This count is incremented (by one) by the SOL stage for each object (point, line, triangle) it writes or attempts to write to the corresponding stream's output buffers. The count is not affected by the actual number of buffers bound to the stream.</p>	Format:	U32
Format:	U32			

Stream Output 0 Write Offset

SOO_WRITE_OFFSET - Stream Output 0 Write Offset				
Register Space:	MMIO: 0/2/0			
Source:	RenderCS			
Access:	R/W			
Size (in bits):	32			
Address:	05280h-05283h			
Name:	Stream Output 0 Write Offset			
ShortName:	SOO_WRITE_OFFSET			
<p>There is one R/W 32-bit register for each of the 4 supported stream output buffer slots: 5280h-5283h SO_WRITE_OFFSET0 (for Stream Out Buffer #0) 5284h-5287h SO_WRITE_OFFSET1 (for Stream Out Buffer #1) 5288h-528Bh SO_WRITE_OFFSET2 (for Stream Out Buffer #2) 528Ch-528Fh SO_WRITE_OFFSET3 (for Stream Out Buffer #3)</p> <p>These registers are used to set and track a DWord-granular Write Offset for each of the 4 Stream Output Buffer slots. Software can directly write them via MI_LOAD_REGxxx commands. The SOL stage will increment them as part of stream output processing. Software can cause them to be written to memory via MI_STORE_REGxxx commands. (See the Stream Output section of the 3D pipeline volume).</p> <p>These registers are part of the context save and restore.</p>				
Programming Notes				
<ul style="list-style-type: none"> • Software must ensure that no HW stream output operations can be in process or otherwise pending at the point that the MI_LOAD/STORE commands are processed. This will likely require a pipeline flush. • The SOL stage will effectively advance the write offset by the buffer's Surface Pitch after each vertex is written (assuming no overflow is detected in any targeted SO buffer). Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so. 				
DWord	Bit	Description		
0	31:2	<p>Write Offset</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 60%;">Format:</td> <td style="text-align: center;">U30</td> </tr> </table> <p>This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).</p>	Format:	U30

Under "normal" conditions one would expect software to initialize the WriteOffset to some (possibly zero) multiple of Surface Pitch in order to align vertex writes to the buffer's Base Address, though it is not required to do so. 				
DWord	Bit	Description		
0	31:2	<p>Write Offset</p> <table border="1" style="width: 100%;"> <tr> <td style="width: 60%;">Format:</td> <td style="text-align: center;">U30</td> </tr> </table> <p>This field contains a DWord offset from the corresponding SO buffer's Base Address value. The SOL stage uses this value as a write offset when performing writes to the buffer. The SOL stage will increment this value as a part of performing stream output to the buffer. Note that the SOL stage uses the buffer's Surface Pitch to advance the Write Offset, without regard to the buffer's Base Address (see Programming Notes above).</p>	Format:	U30
Format:	U30			

SO3_WRITE_OFFSET - Stream Output 3 Write Offset

	1:0	Reserved	
		Format:	MBZ

ShortName:	FF_MODE_RCSUNIT_BE			
Address:	180A0h-180A3h			
Name:	Thread Mode Register			
ShortName:	FF_MODE_POCSUNIT_BE			
This register is used to program the FF shader Mode.				
DWord	Bit	Description		
0	31	TE Autostrip Disable		
		Format: U1		
		Value	Name	Description
		0h	Enable [Default]	TE will generate "autostrip" primitives (if/where possible) during tessellation.
	1h	Disable	TE will not generate "autostrip" primitives.	
	30	TDS external Cache Disable		
		Format: U1		
		Value	Name	Description
		0b	Enable [Default]	The external TDS Cache is enabled if there is enough handles to enable the cache.
	1b	Disable	The external TDS Cache is disabled even if there is enough handles to enable the cache. Only the internal TDS Cache will be used.	
29:26	DS Hit Max Value			
	Format: U4			

FF_MODE - Thread Mode Register

Description		
	<p>If the number of hits reaches the DS Hit Max Value and there is a pending miss to be dispatched, the DS will dispatch the pending miss vertex as a single dispatch.</p> <p>Programming a value of 0 will disable the DS Hit Max counter logic and therefore partial dispatches will <u>not</u> be forced due to the number of hits seen during the accumulation of inputs for a thread dispatch.</p>	
Value	Name	
15	[Default]	
[0,15]		
25:20	<p>VS Hit Max Value</p> <p>Format: U6</p>	
Description		
<p>If the number of hits reaches the VS Hit Max Value and there is a pending miss to be dispatched, the VS will dispatch the pending miss vertex as a single dispatch.</p> <p>Since VS Reference Count Full Force miss enable was removed, the value can be [1,63].</p>		
Value	Name	
10	[Default]	
[1,63]		
19	<p>Tessellation DOP gating Disable</p> <p>Format: Disable</p>	
Value	Name	Description
0h	Enable [Default]	HS, TE, TETG, DS, GS and SOL units are DOP gated if all units are disabled
1h	Disable	DOP gating is disabled for HS, TE, TETG, DS, GS and SOL units
Programming Notes		
Once this bit is set to a 1, it must not be cleared to a 0 until after a reset.		
18	<p>TRI NOINSIDE Autostrip Cache Invalidate Disable</p> <p>Format: Disable</p> <p>This bit can be used to control the TRI NOINSIDE Autostrip Cache Invalidate feature. By default the invalidation is ENABLED (allowing higher performance).</p>	
Value	Name	Description

FF_MODE - Thread Mode Register

		0h	Enable [Default]	TE will suppress the Autostrip cache invalidate for TRI NOINSIDE patches. This setting may improve performance.
		1h	Disable	TE will not suppress the Autostrip cache invalidate for TRI NOINSIDE patches.
Programming Notes				
<p>The setting of this field impacts the selection of the "provoking vertex" for the center triangle of TRI domains (if a center triangle exists given the tessellation factors), and this will in turn impact the generated image if any PS attributes are enabled as "flat shaded" and that/those attributes are not identical on all 3 vertices of the triangle. Given the fact that the APIs do not impose requirements on the starting/provoking vertices of the tessellation-generated triangles, the selection of provoking vertices can be arbitrary as long as it is deterministic (i.e., repeated rendering the same patch will yield the same results).</p> <p>Note: If FF_mode. TE autostrip Disable is set to 1, then TRI NOINSIDE Autostrip Cache Invalidate will also be disabled.</p>				
17	VS DOP Clock gate fix disable			
	Format: _____			
	Value	Name	Description	
	1h		The VS DOP clock gate fix is disabled. The DOP will not be held until the clocks are sampled off.	
	0h	[Default]	The VS DOP clock gate fix is enabled. The DOP enable will be held asserted until the clocks are sampled off.	
16	Reserved			
	Format: _____ MBZ			
15	TDS Bypass Disable

DWord	Bit	Description		
0	31:25	Unified Tile Cache Pool		
		Access:		R/W
		Number of ways allocated for the unified client pool. This is a combined pool for all streams.		
		Value	Name	Description
00h	[Default]	Increments of 4KB per bank	When this field is non-zero, Z tile cache pool and C tile cache pool should be 0KB.	
24:18		Z Tile Cache Pool		
		Access:		R/W
		Number of ways allocated for Z streams.		
		Value	Name	Description
00h	[Default]	Increments of 4KB per bank	Note: This field must be 0KB if Unified Tile cache Pool is non-zero.	
17:11		C Tile Cache Pool		
		Access:		R/W
		Number of ways allocated for Color Streams		
		Value	Name	Description
00h	[Default]	Increments of 4KB per bank	Note: This field must be 0KB if Unified Tile cache Pool is non-zero.	
10:4		Command Streamer Allocation		
		Access:		R/W
		Number of ways allocated for CS(Command Streamer)		
		Value	Name	Description
00h	[Default]	Increments of 4KB per bank		
3		Tile cache path Disable		

TCCNTLREG - Tile Cache Control Register

	Access:	R/W	
	<p>Color and Z Caching Disable bit</p> <p>When caching is disabled, All Z and color requests follow the legacy path to GAM rather than L2 Tile Cache is disabled with default value of this register bit (L3 operate in legacy mode). This register bit value needs to be changed to "0" for caching the C and Z streams in the L3 and forPTBR mode of operation with tile cache.</p>		
	Value	Name	
	[0,1]		
	0h	[Default]	
2	L3 Data partial write merging enable		
	Default Value:	1	
1	Color/Z write partial write merging enable		
	Default Value:	0	
	<p>Disable partial write merging optimization for Color and Z clients. Partial write merging optimization (in SQDB) will be enabled when this bit is set.</p>		
0	URB partial write merging enable		
	Default Value:	1	

TILECTL

TILECTL - TILECTL		
Register Space:	MMIO: 0/2/0	
Source:	BSpec	
Size (in bits):	32	
Address:	101000h	
Tile control and TLB control.		
DWord	Bit	Description
0	31:3	Reserved
		Default Value: 00000000h
		Access: RO
		Reserved
2		Reserved
		Default Value: 0b
		Access: RO
Reserved.		
1		TLBPF
		Default Value: 0b
		Access: R/W
Store multiple PTE enable. 0: Only one Page Table Entry is stored in the Translation Lookaside Buffer cache. 1: Multiple Page Table Entries (8) are stored in the Translation Lookaside Buffer cache.		
0		SWZCTL
		Default Value: 0b
		Access: R/W
In order to spread DRAM accesses between multiple channels in the most efficient way, address bits can be used as a channel select. The Driver needs to obtain the need for memory address swizzling via DRAM configuration registers and set the following bits. x0b - No Address Swizzling x1b - Address bit [6] needs to be swizzled for tiled surfaces		

TiledResources VA Detection Registers

TRVADR - TiledResources VA Detection Registers						
Register Space:	MMIO: 0/2/0					
Source:	BSpec					
Size (in bits):	32					
Address:	04DF0h					
Name:	TiledResources VA Detection Registers					
ShortName:	TRVADR					
DWord	Bit	Description

TRANS_CONF

		0b	Disabled
		1b	Enabled
29:23	Reserved		
22:21	Interlaced Mode These bits control the transcoder interlaced mode. This field is ignored by WD.		
	Value	Name	Description
	00b	PF-PD	Progressive Fetch with Progressive Display
	01b	PF-ID	Progressive Fetch with Interlaced Display
	11b	IF-ID	Interlaced Fetch with Interlaced Display
	Others	Reserved	Reserved
	Programming Notes		
	Progressive Fetch with Interlaced Display requires pipe scaling.		
	Restriction		
	VGA display modes do not work while in interlaced fetch mode. Progressive Fetch with Interlaced Display effectively down scales the vertical by 2X, which reduces the maximum supported pixel rate by half. Interlaced fetch mode is not supported with Y Tiling. Interlaced fetch mode is not supported with 90/270 rotation. Interlaced fetch mode is not supported with scaling. Interlaced fetch mode is not supported with YUV 420 hybrid planar source pixel formats. In Interlaced mode, the plane height must be a minimum of 2 scanlines.		
20:7	Reserved		
	Format:	MBZ	
6:0	DP Audio Symbol Watermark		
	Default Value:	24h 36 entries	
	This fields set the level to which the DP audio symbol RAM must fill before it starts to drain during horizontal blank. The minimum is 2 entries and the maximum is 64.

Description																											

TRANS_DDI_FUNC_CTL

		<p>This bit enables DisplayPort Virtual Channel payload allocation. This bit is ignored by transcoder EDP since it does not support multistreaming.</p> <p>This bit is ignored by transcoder DSI since it does not support multistreaming</p>	
		Value	Name
		0b	Disable
		1b	Enable
7	HDMI Scrambler CTS Enable		
		Description	
		<p>This bit enables Compliance Test Specification mode on the HDMI scrambler. This bit must be set before the scrambler is enabled.</p> <p>This bit is ignored by transcoder DSI</p>	
		Value	Name
		0b	Disable
		1b	True
6	HDMI Scrambler Reset frequency		
		<p>This bit specifies the frequency at which the scrambler is reset when the HDMI Scrambler CTS Enable bit is set.</p> <p>This bit must be set before or along with the HDMI Scrambler CTS Enable bit.</p>	
		Value	Name
		0b	Every Line
		1b	Every Other Line
5	Reserved		
4	High TMDS Char Rate		
		<p>This field enables the high TMDS character rate. It must be enabled when the HDMI link symbol rate is greater than 340 MHz. It must be disabled when the HDMI link symbol rate is less than or equal to 340 MHz.</p>	
		Value	Name
		0	Disable
		1	Enable
3:1	Port Width Selection		
		<p>This field selects the number of lanes to be enabled on the DDI link for DisplayPort and DSI. for DSI, this field specifies the number of Data lanes to use - the Clock lane is always enabled when the DSI function is enabled. This field is ignored for HDMI and DVI which always use all 4 lanes.</p>	

TRANS_DDI_FUNC_CTL

The value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe.

Value	Name	Description
000b	x1	x1 Mode
001b	x2	x2 Mode
010b	x3	x3 Mode (DSI only)
011b	x4	x4 Mode
Others	Reserved	Reserved

Restriction

This field must not be changed while the DDI is enabled.

0 **HDMI Scrambling Enabled**

--	--

Setting this bit enables scrambling over the HDMI link.
 Scrambling must be enabled when the HDMI link symbol rate is greater than 340 MHz.
 Scrambling should be enabled at lower frequencies if the receiver supports it at that speed.
 This must not be changed while the port is enabled.

Value	Name
0b	Disable
1b	Enable

		001b	18-bit RGB, 6-6-6 (Packed)
		010b	18-bit RGB, 6-6-6 (Loose)
		011b	24-bit RGB, 8-8-8
		100b	30-bit RGB, 10-10-10
		101b	36-bit RGB, 12-12-12
		110b	Compressed
		Others	Reserved
Restriction			
When in the 18-bit RGB (Packed) pixel format, the H. Active Size must be a multiple of 4 pixels			
15	BGR Transmission		
	Access:	R/W	
	This field will reverse the order of the RGB channels within the pixels received from the Display Engine		
	Value	Name	
	0	Transmit order is R-G-B	
	1	Transmit order is B-G-R	
14	Reserved		
	Format:	MBZ	
13:12	Pixel Virtual Channel		
	Access:	R/W	
	This field defines the Virtual Channel that HW will bind to all DSI packets carrying pixel data		
11:10	Pixel Buffer Threshold		
	Access:	R/W	
	This field defines the threshold of buffering needed within the Pixel Buffer before the transcoder will start internally processing the pixel stream.		
	Value	Name	
	00b	The Pixel Buffer will have to be 1/4 full	
	01b	The Pixel Buffer will have to be 1/2 full	
	10b	The Pixel Buffer will have to be 3/4 full	
	11b	The Pixel Buffer will have to be full	
9:8	Continuous Clock		
	Access:	R/W	
	This field will control the behavior of the Clock Lane and whether it is allowed to enter the LP state.		
	Keeping the Clock Lane running while letting the Data Lanes go in and out of the LP state keeps the LP to HS turnaround latency to a minimum, but consumes more power.		

TRANS_DSI_FUNC_CONF

		Certain panels may also require the Clock Lane to continuously run	
		Value	Name
		00b	Always enter LP after Data Lanes
		10b	Opportunistically keep Clock in HS or LP
		11b	Continuous HS Clock
		Others	Reserved
7:6	Reserved		
		Format:	MBZ
5:4	Link Calibration		
	Access:		R/W
	This field will control the Link calibration of the DSI Transcoder		
	Value	Name	
	00b	Calibration Disabled	
	10b	Calibration Enabled - Initial only	
	11b	Calibration Enabled - Initial and Periodic	
	Others	Reserved	
	Restriction		
	Calibration can be enabled for any Link frequency, but it must be enabled when the Link frequency is operating above 1.5 Gbps		
3:2	Reserved		
		Format:	MBZ
1	S3D Orientation		
	Access:		R/W
	This bit controls the orientation encoding of the 3DMODE field of the Stereoscopic 3D control function sent to a Panel via the Vertical Source Sync (VSS) packet when in Video Mode.		
	Value	Name	
	0b	Portrait Orientation	
	1b	Landscape Orientation	
	Programming Notes		
	This bit will only be sampled by the transcoder when Stereoscopic 3D is enabled for the transcoder		
	This bit should be programmed before enabling Stereoscopic 3D for the transcoder (TRANS_STEREO3D_CTL)		
	If Software changes this bit, it must also perform a write to the TRANS_STEREO3D_CTL for the		

TRANS_DSI_FUNC_CONF

		<p>change to be sent within the next VSS</p> <p>This bit is only applicable when the transcoder is operating in Video Mode. If the transcoder is operating in Command Mode, then Software will have to communicate the Stereoscopic 3D function information to the Panel through a set_3D_control DCS command using the DCS Long Write DSI packet type.</p>
0	EoTp Disabled	
	Access:	R/W
	When set, the DSI transcoder will not transmit an End of Transmission packet at the end of High Speed bursts	
	Value	Name
	0	EoTp Enabled
	1	EoTp Disabled

TRANS_FRM_TIME

TRANS_FRM_TIME - TRANS_FRM_TIME					
Register Space:	MMIO: 0/2/0				
Source:	BSpec				
Access:	Double Buffered				
Size (in bits):	32				
Double Buffer Update Point:	Start of capture sync or transcoder not enabled				
Address:	6E020h-6E023h				
Name:	TRANS_FRM_TIME_WD0				
ShortName:	TRANS_FRM_TIME_WD0

This register selects what value will be sent in the DisplayPort Main Stream Attribute (MSA) Miscellaneous (MISC) fields. The MSA MISC fields are mostly used to indicate the color encoding format and need to be programmed to indicate color space, bits per color, etc.	
Programming Notes	
See the DisplayPort specification for the details on what to program in these fields.	

DWord	Bit	Description
0	31:16	<p>MSA Unused This field selects the value that will be sent in the DisplayPort MSA unused fields.</p> <p style="text-align: center;">Programming Notes</p> <p>This should be usually programmed with all 0s.</p>
	15:8	<p>MSA MISC1 This field selects the value that will be sent in the DisplayPort MSA MISC1 field. When TRANS_STEREO3D_CTL bit FS_MSA_MISC1_Drive_En is enabled, hardware will drive MISC1 bits 2:1 (bits 10:9 of this register) with the field sequential stereo 3D left or right eye indication, and any value written to those bits here will be ignored.</p>
	7:0	<p>MSA MISC0 This field selects the value that will be sent in the DisplayPort MSA MISC0 field.</p> <p style="text-align: center;">Restriction</p> <p>Before enabling DisplayPort, bit 0 should always be set to 1 to indicate link clock and stream clock are synchronous.</p>

This register is sampled one line before vertical blank.

DWord	Bit	Description						
0	31	<p>Transcoder S3D Enable This bit enables the stereo 3D modes on this transcoder. Updates will take place at the start of the next vertical blank.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0b</td> <td style="text-align: center;">Disable</td> </tr> <tr> <td style="text-align: center;">1b</td> <td style="text-align: center;">Enable</td> </tr> </tbody> </table> <p style="text-align: center;">Restriction</p> <p>These modes are only for use with DisplayPort, HDMI, and DVI. HDMI/DVI: Stereo 3D can only be enabled with a mode set. It must be enabled before transcoder and port are enabled. It must be disabled after transcoder is disabled. DisplayPort: Stereo 3D can be enabled and disabled with a mode set, like HDMI and DVI, or it can be enabled after an enable mode set is complete and disabled prior to a disable mode set. VGA display modes, interlaced modes, SRD/PSR, WD, and frame buffer compression (FBC) do not work with stereo 3D. The left surface base address registers for the planes going to this transcoder must be programmed with valid addresses prior to enabling stereo 3D.</p>	Value	Name	0b	Disable	1b	Enable
Value	Name							
0b	Disable							
1b	Enable							
	30:29	Reserved						
	28:27	<p>S3D Mode This field selects between the stereo 3D modes. The stacked buffer mode combines both stereo 3D fields (left and right eye images) into a single tall frame with the left eye image on top, then a programmable space of black lines, then the right eye image on the bottom. The field sequential mode sends one stereo 3D field (left or right eye image) out per frame. This mode is only for use with DisplayPort. Field sequential hardware controlled mode automatically toggles between left and right eye at the start of each vertical blank. The starting field is selected using the FS_Field_Ctl register bit. Field sequential software controlled mode will manually select left or right eye using the FS_Field_Ctl register bit.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">00b</td> <td style="text-align: center;">FS_HW_Auto</td> <td>Hardware controlled auto-toggle between left and right eye on each vertical blank.</td> </tr> </tbody> </table>	Value	Name	Description	00b	FS_HW_Auto	Hardware controlled auto-toggle between left and right eye on each vertical blank.
Value	Name	Description						
00b	FS_HW_Auto	Hardware controlled auto-toggle between left and right eye on each vertical blank.						

TRANS_STEREO3D_CTL

	01b	FS SW Manual	Software controlled selection between left and right eye
	10b	Stacked	Stacked frame mode with both left and right eye images combined in a single tall frame
	Others	Reserved	Reserved
Programming Notes			
In the stacked frame mode, a vertical sync is not generated in the gap between left and right eye images, and the scan line count increments across the entire tall frame.			
Restriction			
This field should only be changed when stereo 3D is disabled.			
26	FS Field Ctl		
	The operation of this bit depends on the S3D Mode setting. This field is ignored in the S3D stacked mode. In the field sequential software controlled mode this bit selects the field sequential stereo 3D field (left or right eye). In the field sequential hardware controlled mode this bit selects the field sequential stereo 3D starting field, the field used on the frame when field sequential stereo 3D is enabled. Hardware does not wait for a specific eye when disabling.		
	Value	Name	
	0b	Right Eye	
	1b	Left Eye [Default]	
Restriction			
The starting field must be set to the left eye for FS HW Auto usage.			
25	Reserved		
	Format:	MBZ	
24	S3D Current Field		
	Access:	RO	
	This read only bit indicates the current stereo 3D field (left or right eye). This bit should be ignored when stereo 3D is not enabled.		
	Value	Name	
	0b	Right Eye	
	1b	Left Eye	
23	FS MSA MISC1 Drive En		
	This bit enables hardware to drive the MSA MISC1 bits 2:1 with the internal field sequential stereo 3D left/right eye field indication. Hardware will drive 00 when field sequential 3D stereo mode is not enabled, 01 when enabled and the upcoming video frame is the right eye, 11 when enabled and the upcoming video frame is the left eye. This is based on the internal left/right indication which could be either generated by hardware in the HW auto mode or by software in the SW manual mode. FS_MSA_Drive_Invert can be programmed to invert the left and right eye		

TRANS_STEREO3D_CTL

	selection in the MSA. When this bit is disabled, software may manually program TRANS_MSA_MISC to set MISC1 bits 2:1.		
	Value	Name	Description
	0b	Disable	Disable hardware driving MSA MISC1 bits 2:1. Allow software to manually program MSA MISC1 bits 2:1 through TRANS_MSA_MISC.
	1b	Enable	Enable hardware to drive MSA MISC1 bits 2:1 for stereo 3D.
	Restriction		
	This field should only be changed when stereo 3D is disabled and should not be enabled for the stacked frame mode.		
22	Reserved		
21:0	Reserved

	1b	Enable						
	30	Triggered Capture Mode Enable						
		<table border="1"> <tbody> <tr> <td></td> <td></td> </tr> </tbody> </table>						
	This field enables the triggered capture mode where a frame is only captured after the Start Trigger Frame bit is written with 1, and hardware will ignore the transcoder frame time. This must be set before or when WD Function Enable is set. When triggered capture mode is disabled hardware will periodically capture frames following the transcoder frame time.							
	<table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>0b</td> <td>Disable</td> </tr> <tr> <td>1b</td> <td>Enable</td> </tr> </tbody> </table>	Value	Name	0b	Disable	1b	Enable	
Value	Name							
0b	Disable							
1b	Enable							
29		Start Trigger Frame						

TRANS_WD_FUNC_CTL

	Access:	R/W Set	
	Write a 1 to this field to start a software triggered frame capture when Triggered Capture Mode Enable is 1. Hardware will clear the field when the frame starts.		
28	Stop Trigger Frame		
	Access:	R/W Set	
	Write a 1 to this field to stop a software triggered frame capture when Triggered Capture Mode Enable is 1. Hardware will clear the field when the frame stops. This is only intended for use in case of an error where capture is never completing and software times out. It must not be set at the same time as Start Trigger Frame. After a stop trigger, VDenc will be out of sync with WD and also need to be stopped. WD and VDenc then need to start from the same frame number.		
27	Reserved		
	Format:	MBZ	
26	Chroma Filtering Enable		
	This field selects how U and V are downsampled from YUV 444 to 422. This field only applies to the YUV 422 formats.		
	Value	Name	Description
	0	Drop	Drop U2 and V2
	1	Filter [Default]	Use a 15-34-15 three tap filter
25:23	Reserved		
	Format:	MBZ	
22:20	WD Color Mode		
	This field selects the capture color format.		
	Value	Name	Description
	000b	YUV 4:4:4	YUV 32-bit 4:4:4 packed (8:8:8:8 MSB-Y:U:X:V)
	001b	YUV 4:2:2	YUV 16-bit 4:2:2 packed (8:8:8:8 MSB- Y1:U:Y2:V) Chroma downsampling is programmable according to the Chroma Filtering field.
	010b	XYUV 4:4:4	YUV 32-bit 4:4:4 packed (8:8:8:8 MSB-X:Y:U:V)
	011b	RGBX	RGBX 32-bit (8:8:8:8 MSB-X:B:G:R)
	100b	Y410	YUV 444 10bpc (MSB-X:V:Y:U)
	101b	YUY2 8b	8 bit YUV 422 (MSB-V:Y2:U:Y1) Chroma downsampling is programmable

TRANS_WD_FUNC_CTL

			according to the Chroma Filtering field.
	110b	RGB10	RGB1010102 (MSB-X:B:G:R)
Restriction			
This field must not be changed while the function is enabled.			
19:16	Reserved		
	Format:		MBZ
15	Reserved		
	Format:		MBZ
14:12	WD Input Select		
	These bits determine the input to WD.		
	Value	Name	
	000b	Pipe A	
	101b	Pipe B	
	110b	Pipe C	
	Others	Reserved	
Restriction			
This field must not be changed while the function is enabled. It is not valid to have the same pipes driving multiple enabled transcoders.			
11:4	Reserved		
	Format:		MBZ

UTIL_PIN_CTL

UTIL_PIN_CTL										
Register Space:	MMIO: 0/2/0									
Source:	BSpec									
Access:	R/W									
Size (in bits):	32									
Address:	48400h-48403h									
Name:	Utility Pin Control									
ShortName:	UTIL_PIN_CTL									
Power:	PG0									
Reset:	soft									
<p>This register controls the display utility pin. The nominal supply is 1 Volt and can be level shifted depending on usage. The maximum switching frequency is 100 KHz.</p>										
DWord	Bit	Description								
0	31	Util Pin Enable This bit enables the utility pin. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>0b</td> <td>Disable</td> </tr> <tr> <td>1b</td> <td>Enable</td> </tr> </tbody> </table>	Value	Name	0b	Disable	1b	Enable		
		Value	Name							
		0b	Disable							
		1b	Enable							
	30:29	Pipe Select This bit selects which pipe will be used when the utility pin is outputting timing related signals. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> </tr> </thead> <tbody> <tr> <td>00b</td> <td>Pipe A</td> </tr> <tr> <td>01b</td> <td>Pipe B</td> </tr> <tr> <td>10b</td> <td>Pipe C</td> </tr> </tbody> </table>	Value	Name	00b	Pipe A	01b	Pipe B	10b	Pipe C
		Value	Name							
		00b	Pipe A							
		01b	Pipe B							
		10b	Pipe C							
	Restriction									
The field should only be changed when the utility pin is disabled or not configured to use any timing signals.										
28	Reserved									
27:24	Util Pin Mode This bit configures the utility pin mode of operation for output. <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0000b</td> <td>Data</td> <td>Output the Util_Pin_Output_Data value.</td> </tr> </tbody> </table>	Value	Name	Description	0000b	Data	Output the Util_Pin_Output_Data value.			
	Value	Name	Description							
	0000b	Data	Output the Util_Pin_Output_Data value.							

UTIL_PIN_CTL

	0001b	PWM	Output from the backlight PWM circuit.				
	0100b	Vblank	Output the vertical blank.				
	0101b	Vsync	Output the vertical sync.				
	1000b	Right/Left Eye Level	Output the stereo 3D right/left eye level signal. Asserted for the left eye and de-asserted for the right eye.				
	Others	Reserved	Reserved				
Restriction							
The field should only be changed when the utility pin is disabled.							
23	Util Pin Output Data This bit selects what the value to drive as an output when in the data mode.						
	Value		Name				
	0b		0				
	1b		1				
22	Util Pin Output Polarity This bit inverts the polarity of the pin output.						
	Value		Name				
	0b		Not inverted				
	1b		Inverted				
21:20	Reserved						
19	Util Pin Direction This bit selects whether the pin is used as an output or an input.						
	Value		Name				
	0b		Output				
	1b		Input				
Restriction							
The field should only be changed when the utility pin is disabled.							
18:17	Reserved						
16	Util Pin Input Data <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 80%; height: 20px;"></td> <td style="width: 20%;"></td> </tr> <tr> <td>Access:</td> <td>RO</td> </tr> </table> This bit gives the value received on the pin. This is only valid when the utility pin is enabled and the direction is input.					Access:	RO
Access:	RO						
15:0	Reserved

		1: Enabled for LLC	
6	Dont allocate on miss	Default Value:	0b
		Access:	R/W
	<p>Controls defined for RO surfaces in mind, where if the target cache is missed - do not bring the line (applicable to LLC/eDRAM).</p> <p>0: Allocate on MISS (normal cache behavior)</p> <p>1: Do NOT allocate on MISS</p> <p>Received confirmation from Altug on 03/13/13 that nothing needs to be done on this bit</p>		
5:4	LRU management	Default Value:	11b
		Access:	R/W
	<p>This field allows the selection of AGE parameter for a given surface in LLC or eLLC. . If a particular allocation is done at youngest age ("3") it tends to stay longer in the cache as compared to older age allocations ("2", "1", or "0"). This option is given to driver to be able to decide which surfaces are more likely to generate HITS, hence need to be replaced least often in caches.</p> <p>When Target Cache(TC) == 00, LRU Age value will be from Private PAT registers(40E0/40E8/40EC)</p> <p>When Target Cache(TC) != 00, LRU Age value will be from MOCS as follows</p> <p>11: Assign the age of "3"</p> <p>10: do not change the age on a hit.</p> <p>01: Assign the age of "0"</p> <p>00: Take the age value from Uncore CRs</p>		
3:2	Target Cache	Default Value:	00b
		Access:	R/W
	<p>This field allows the choice of LLC vs eLLC for caching</p> <p>00: Value from Private PAT registers(40E0/40E4/40E8/40EC)</p> <p>01: LLC Only</p> <p>10: LLC/eLLC Allowed</p> <p>11: LLC/eLLC Allowed</p>		
1:0	LLC/eDRAM cacheability control	Default Value:	00b
		Access:	R/W
	<p>Memory type information used in LLC/eDRAM.</p> <p>00: Use Cacheability Controls from page table / UC with Fence (if coherent cycle)</p> <p>01: Uncacheable (UC) - non-cacheable</p> <p>10: Writethrough (WT)</p>		

VEBX2_MOCS - VEBOX2 MOCS Register

11: Writeback (WB)

Note: Binding table index based memory typing cannot be used for LLC/eDRAM memory type. Instead page table based controls have to be used

Note: In case of SVM (advanced context), LLC/eDRAM memory type is used based on the page table controls and cannot be managed via MOCS index

Access:	R/W			

VECGCTL3F00 - Vebox Power Context Save request

Minimum Credits = 1 : Unit may send 1 QWord pair (enough for first LRI at least)

Maximum Credits = 511 : Unit may send 511 QWord pairs

A QWord pair is defined as a 32-bit register address and the corresponding 32-bits of register data. Note that the LRI header and END commands are 64-bits each (32-bit command followed by 32-bit NOOP) and will consume one QWord credit.

Only valid with PWRCTX_SAVE_REQ (Bit9).

ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS2			
Address:	1FA018h			
ShortName:	VE_SFC_FORCED_LOCK_ACK_VECS3			
DWord	Bit	Description		
0	31:1	Reserved Format: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td>MBZ</td></tr></table>		MBZ
		MBZ		
0	VE_SFC_FORCED_LOCK_ACK Format: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td>U1</td></tr></table> This bit can only be set by hardware and it has to be clear by hardware as well. This bit is going to be polled by driver. This bit indicates that VE has received MFX_SFC_Forced_Lock from driver and it has sent that signal to SFC. Once this bit is set, it indicates SFC status (lock or unlock) will not be changed anymore. Driver will be safe to start the reset process after this bit is set. Hardware has to de-assert this bit after driver de-assert VE_SFC_Forced_Lock as well.		U1	
	U1			

VE SFC Forced Lock Register

VE_SFC_FORCED_LOCK - VE SFC Forced Lock Register			
Register Space:	MMIO: 0/2/0		
Source:	VideoEnhancementCS		
Access:	WO		
Size (in bits):	32		
Address:	1CA01Ch		
Address:	1DA01Ch		
Address:	1EA01Ch		
Address:	1FA01Ch		
DWord	Bit	Description	
0	31:1	Reserved Format: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td></tr></table> MBZ	
0	VE_SFC_FORCED_LOCK Format: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td></tr></table> U1 This bit can only be set by driver and it has to be clear by driver as well. Driver should set this bit before issuing the software (watchdog timer) reset. It tells VEBox that a software reset is going to happen. VE then issues a forced lock to SFC. If SFC is currently locked to VE, SFC should not unlock itself from VE. If SFC is NOT currently locked to VE, SFC should not accept the lock request from VE. Driver needs to clear this bit after the software reset sequence is complete.		

VE VFW SFC Usage Register

VE_SFC_USAGE - VE VFW SFC Usage Register		
Register Space:	MMIO: 0/2/0	
Source:	VideoEnhancementCS	
Access:	RO

Default Value:	0b					

VF_FENCE_LSB

		Access:	R/W
		This field specifies the spatial ordering of QW within tiles. 0b - Consecutive SWords (32B) sequenced in the X direction 1b - Consecutive OWords (16B) sequenced in the Y direction	
	0	FENCEVAL	
		Access:	R/W
		This field specifies whether or not this fence register defines a fence region.	
		Value	Name
		0b	Fence Invalid [Default]
		1b	Fence Valid

Virtual Fence Registers MSBs		
DWord	Bit	Description
0	31:12	FENCEUP
		Default Value: 00000000h
		Access: R/W
Bits 31:12 of the ending Graphics Address of the fence region. Fence regions must be aligned to a 4KB page. This address represents the last 4KB page of the fence region (Upper Bound is included in the fence region). Graphics Address is the offset within GMADR space.		
11		Reserved
		Default Value: 0b
		Access: RO
Reserved		
10:0		Pitch
		Default Value: 000h

VF_FENCE_MSB

Access:

R/W

This field specifies the width (pitch) of the fence region in multiple of tile widths.
For Tile X this field must be programmed to a multiple of 512B (003 is the minimum value) and
for Tile Y this field must be programmed to a multiple of 128B (000 is the minimum value).

000h = 128B

001h = 256B

002h = 384B

003h = 512B

004h = 640B

005h = 768B

006h = 896B

007h = 1024B

...

3FFh = 128KB

4FFh = 160KB

5FFh = 192KB

6FFh = 224KB

7FFh = 256KB

ShortName:	VF_SW_FLAG_3	
Each Virtual Function has 4x32bit Software Flag registers, which can be used as scratch registers.		
DWord	Bit	Description
0	31:0	Data
		Default Value: 00000000h
		Access: R/W
		The format of this register is defined by Software.

VF Scratch Pad

VFSKPD - VF Scratch Pad				
Register Space:	MMIO: 0/2/0			
Source:	RenderCS			
Access:	R/W			
Size (in bits):	32			
Address:	083A8h-083ABh			
Name:	VF Scratch Pad			
ShortName:	VFSKPD_VFUNIT			
Address:	16EA8h-16EABh			
Name:	VF Scratch Pad			
ShortName:	VFSKPD_VFRUNIT			
DWord	Bit	Description		
0	31:16	Mask		
		Access:	WO	
		Format:	Mask[15:0]	
		Must be set to modify corresponding bit in Bits 15:0. (All bits implemented)		
	15	VFCACHE deadlock disable		
		Access:	R/W	
		Format:	PBC	
		Value	Name	Description
		0h	[Default]	The vfcache will stall elements on a vertex boundary to ensure elements will be synchronized on vertex boundaries.
		1h		The vfcache will allow elements on a vertex boundary to get one element out of order.
14:13	Reserved			
	Access:	R/W		
	Format:	PBC		
12	Reserved			

VFSKPD - VF Scratch Pad

	Access:	R/W
	Format:	PBC
11	POLYGON PrimitiveID Fix Disable	
	Access:	R/W
	Format:	Disable
	Value	Name
	0h	Enable [Default]
	1h	Disable
	Description	
	PrimitiveID is constant across all triangles of a POLYGON.	
	PrimitiveID is incremented for each triangle of a POLYGON.	
10	VF POSH Starvation Disable	
	Access:	R/W
	Format:	Disable
	Value	Name
	0h	Enable [Default]
	1h	Disable
	Description	
	The VF will inform OVR when it is starved for POSH token data.	
	The VF will not inform OVR when it is starved for POSH token data.	
9	Partial Autostrip Disable	
	Access:	R/W
	Format:	Disable
	Value	Name
	0h	Enable [Default]
	1h	Disable
	Description	
	The VF can generate "partial autostrip" primitives from TRILIST inputs (if/when possible).	
	VF will not generate "partial autostrip" primitives	
8	Reserved	
	Access:	R/W
	Format:	PBC
7	Reserved	
	Access:	R/W
	Format:	PBC
6	Autostrip Disable	

VFSKPD - VF Scratch Pad

	Access:		R/W
	Format:		U1
	Value	Name	Description
	0h	Enable [Default]	The VF can generate "autostrip" primitives from TRILIST inputs (if/when possible).
	1h	Disable	VF will not generate "autostrip" primitives.
5	TLB Prefetch Enable		
	Access:		R/W
	Format:		U1
	Value	Name	Description
	0h	Disable [Default]	The VF will generate prefetch of TLB when it is fetching sequential vertex data and four or fewer vertex buffers are valid.
	1h	Enable	VF will disable prefetch of TLB entries.
4	4th Vertex Data Pipe Disable		
	Access:		R/W
	Format:		Disable
	Value	Name	Description
	0h	[Default]	The 4th Vertex Data Pipe is enabled.
	1h		The 4th Vertex Data Pipe is disabled.
	Programming Notes		
	This is only valid when there are 3 or more vertex data pipes.		
3	Nullprim early credit release disable		
	Access:		R/W
	Value	Name	Description
	0h	[Default]	The nullprim credit release will be returned to csunit when the upper pipe of vfunit is empty.
	1h		The nullprim credit release will be returned to csunit when the upper pipe and the lower pipe of vfunit are empty.

VFSKPD - VF Scratch Pad

2	Vertex Cache Implicit Disable Inhibit	
Access:		R/W
Format:		U1
Value	Name	Description
0h	[Default]	Allow VF to disable VS0 when Sequential index or Prim ID is a valid Element.
1h		VF never implicitly disables the vertex cache. Software must disable the VS0 Cache when required.
1	Disable Over Fetch Cache	
Access:		R/W
Value	Name	Description
0h	[Default]	Cache will check for data in cache before making a request to memory
1h		Always re-fetch new data from memory.
Programming Notes		
Note that the Disable Multiple Miss Read squash bit must be cleared for Disable Over Fetch Cache to be set.		
0	Disable Multiple Miss Read squash	
Access:		R/W
Format:		Disable
Value	Name	Description
0h	[Default]	Allow VF to squash reads that are to the same cacheline for vertex buffer requests.
1h		Disallow VF from squashing reads that are to the same cacheline for vertex buffer requests.

VFW Credit Count Register

VFW_CREDIT_CNT - VFW Credit Count Register					
Register Space:	MMIO: 0/2/0				
Source:	VideoEnhancementCS				
Access:	RO				
Size (in bits):	32				
Trusted Type:	1				
Address:	1CA010h				
ShortName:	VFW_CREDIT_CNT_VECS0				
Address:	1DA010h				
ShortName:	VFW_CREDIT_CNT_VECS1				
Address:	1EA010h

Address:	1FA010h				
ShortName:	VFW_CREDIT_CNT_VECS3				
DWord	Bit	Description			
0	31:8	Reserved			
	7:0	Credit Count The number of outstanding credits between VFW and GAV. If zero VEBOX cannot proceed due to GAV not releasing credits.			
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">4h</td> <td style="text-align: center;">[Default]</td> </tr> </tbody> </table>	Value	Name	4h
Value	Name				
4h	[Default]				

VGA_CONTROL

VGA_CONTROL			
Register Space:	MMIO: 0/2/0		
Source:	BSpec		
Access:	R/W		
Size (in bits):	32		
Address:	41000h-41003h		
Name:	VGA Control		
ShortName:	VGA_CONTROL		
Power:	PG0		
Reset:	global		
Restriction			
VGA requires panel fitting to be enabled. VGA is always connected to pipe A. VGA can not be enabled while the display power well is powered down. VGA display should only be enabled if all display planes other than VGA are disabled.			
DWord	Bit	Description	
0	31	VGA Display Disable This bit will disable the VGA compatible display mode. It has no effect on VGA register or A0000-BFFFF memory aperture accesses which are controlled by the PCI configuration and VGA I/O register settings.	
		Value	Name
		0b	Enable
		1b	Disable [Default]
Restriction			
The VGA SR01 screen off bit must be programmed when enabling and disabling VGA. See the VGA Registers document.			
	30:27	Reserved	
	26	VGA Border Enable This bit determines if the VGA border areas are included in the active display area. The border will be scaled along with the pixel data.	
		Value	Name
		0b	Disable
		1b	Enable
	25	DBuf Clock Gate	

VGA_CONTROL

	Access:		R/W
	<p>The bit controls the Display buffer clocking when VGA is used. Software must set this bit to 0b before enabling VGA and set it to 1b after VGA gets disabled.</p>		
24	Pipe CSC Enable		
	Description		
	This bit enables pipe color space conversion and the pipe pre-CSC gamma for the VGA pixel data.		
	Value	Name	
	0b	Disable	
	1b	Enable	
23:21	Reserved		
20	Legacy 8Bit Palette En		
	This bit affects reads and writes to the palette through VGA I/O addresses. In the 6-bit mode, the 8-bits of data are shifted up two bits on the write (upper two bits are lost) and shifted two bits down on the read. This provides backward compatibility for original VGA programs as well as VESA VBE support for 8-bit palette. It does not affect palette accesses through the palette register MMIO path.		
	Value	Name	
	0b	6 bit DAC	
	1b	8 bit DAC	
19	Reserved		
18	Reserved		
17:16	Reserved		
15:12	Reserved		
11:8	Reserved		
7:6	Blink Duty Cycle		
	Controls the VGA text mode blink duty cycle relative to the VGA cursor blink duty cycle.		
	Value	Name	Description
	00b	100%	100% Duty Cycle, Full Cursor Rate
	01b	25%	25% Duty Cycle, 1/2 Cursor Rate
	10b	50%	50% Duty Cycle, 1/2 Cursor Rate
	11b	75%	75% Duty Cycle, 1/2 Cursor Rate
5:0	VSYNC Blink Rate		
	Controls the VGA blink rate in terms of the number of VSYNCs per on/off cycle.		
	Programming Notes		
	Program with (VSYNCs/cycle)/2-1

CD and PP bits in GCP set to zero.	1b	Indicate	Indicate color depth using CD bits in GCP. The color depth value comes from the TRANS_DDI_FUNC_CTL register.
	Value	Name	Description								
	0b	Don't Indicate	Don't indicate color depth. CD and PP bits in GCP set to zero.								
1b	Indicate	Indicate color depth using CD bits in GCP. The color depth value comes from the TRANS_DDI_FUNC_CTL register.									
		Restriction									

VIDEO_DIP_GCP

This bit must be set when in HDMI deep color (>8 BPC) mode.

- 1 **GCP default phase enable**
GCP default phase indicates that video timings meet alignment requirements such that the following conditions are met:
1. Htotal is a multiple of the value given in the table below
 2. Hactive is an even number
 3. Front and back porches for Hsync are even numbers
 4. Vsync always starts on an even-numbered pixel within a line in interlaced modes (starting counting with 0)

BPC	Color Format	Htotal Multiple Requirement
8	RGB	2
8	YUV420	4
10	RGB	4
10	YUV420	8
12	RGB	2
12	YUV420	4

Value	Name	Description
0b	Clear	Default phase bit in GCP is cleared.
1b	Set	Default phase bit in GCP is set.

Restriction

Do not set this bit if these requirements are not met.

- 0 **Reserved**

VS Invocation Counter

VS_INVOCATION_COUNT - VS Invocation Counter		
Register Space:	MMIO: 0/2/0	
Source:	RenderCS	
Access:	R/W	
Size (in bits):	64	
Trusted Type:	1	
Address:	02320h-02327h

SYNC_FLIP_STATUS_1 - Wait For Event and Display Flip Flags Register 1

	Pending Condition (in the Device Programming Interface chapter of MI Functions).	
5	Display Plane 3 Synchronous Flip Pending Wait Enable	
	Format:	Enable
	This field enables a wait for the duration of a Display Plane 3 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition (in the Device Programming Interface chapter of MI Functions).	
4	Display Plane 6 Synchronous Flip Pending Wait Enable	
	Format:	Enable
	This field enables a wait for the duration of a Display Plane 6 Flip Pending condition. If a flip request is pending, the parser will wait until the flip operation has completed (i.e., the new front buffer address has now been loaded into the active front buffer registers). See Display Flip Pending Condition in the Device Programming Interface chapter of MI Functions.	
3	Reserved	
	Format:	MBZ
2	Display Pipe C Scan Line Wait Enable	
	Format:	Enable
	This field enables a wait while a Display Pipe C Scan Line condition exists. This condition is defined as the start of the scan line specified in the Pipe C Display Scan Line Count Range Compare Register. See Scan Line Event in the Device Programming Interface chapter of MI Functions.	
1	Display Pipe C Vertical Blank Wait Enable	
	Format:	Enable
	This field enables a wait until the next Display Pipe C Vertical Blank event occurs. This event is defined as the start of the next Display Pipe C vertical blank period. Note that this can cause a wait for up to an entire refresh period. See Vertical Blank Event (See Programming Interface).	
0	Reserved	
	Format:	MBZ

Programming Notes

Source

Ring Buffer Mode of scheduling SW must enable and disable watch dog counter inline to a command sequence of any given workload within the same command buffer dispatch. Watch Dog counter once enabled doesn't stop unless it is explicitly disabled. SW must explicitly reset the watch dog counter by disabling it before enabling the watch dog counter for a new command sequence. Preemption could happen in a command sequence prior to watch dog counter getting disabled resulting in watch dog counter enabled following preemption. SW must explicitly take care of disabling the watch dog counter as part of the preemption sequence. Execution List Mode of Scheduling: SW must enable and disable watch dog counter inline to a command sequence of any given workload within the same command buffer dispatch. On a context switch "Watch Dog Counter Control" and "Watch dog Threshold" are context save restored, whereas watch dog counter gets reset to 0x0 and remains disabled until it gets enabled by another context during context restore or due to explicit programming. Watch dog counter value doesn't get accumulated across multiple submissions of a given context.

This register functionality is not supported and must not be programmed for Position command streamer.

PositionCS

DWord	Bit	Description				
0	31	<p>Count Select</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 70%; height: 20px;"></td> <td style="width: 30%;"></td> </tr> <tr> <td>Format:</td> <td style="text-align: center;">U1</td> </tr> </table>			Format:	U1
Format:	U1					

PR_CTR_CTL - Watchdog Counter Control

Value	Name	Description
0h	[Default]	Use eight times the time stamp base unit to increment the watch dog count. The granularity of the time stamp base unit is defined in the "Time Stamp Bases" subsection in Power Management chapter.
1h		Use the fixed function clock (csclk) to increment the watchdog count
30:0	Counter Logic Op	
	Default Value:	1h
	This field specifies the action to be taken by the clock counter to generate interrupts. Writing a Zero value to this register starts the counting. Writing a Value of 0000_0001 to this counter stops the counter.

Programming Notes	Source
This register functionality is not supported and must not be programmed for Position command streamer.	PositionCS
This register must never be programmed with zero. This will cause the watchdog counter to exceed and not allow the engine to go into IDLE state.	

DWord	Bit	Description				
0	31:0	<p>Counter Logic Threshold</p> <table border="1" style="width: 100%;"> <tr> <td>Default Value:</td> <td style="text-align: center;">00145855h</td> </tr> <tr> <td>Format:</td> <td style="text-align: center;">U32</td> </tr> </table> <p>This field specifies the threshold that the hardware checks against for the value of the render clock counter before generating an interrupt. The counter in hardware generates an interrupt when the threshold is reached, rolls over and starts counting again. The interrupt generated is the "Media Hang Notify" interrupt since this watchdog timer is intended primarily to remedy VLD hangs on the main pipeline.</p>	Default Value:	00145855h	Format:	U32

DWord	Bit	Description
0	31:16	Reserved Format: MBZ
	15:6	WD Stride This field specifies the stride bits 15:6. This value is used to determine the line to line increment for the capture data writes. This field is programmed in units of 64 bytes. Programming Notes The stride has to be at least large enough to encompass all the pixels in a line, and rounded up to 64 byte alignment. Stride bytes \geq CEILING[(Horizontal Active * WD Color Mode bytes per pixel) / 64] * 64
		Restriction The stride is limited to a maximum of 32K bytes.
5:0		Reserved
		Format: MBZ
